Table of Contents

Chapter 1: Introduction	6
1.1 Intended Audience	6
1.2 Data Flow Path with Peer Memory Direct	7
1.3 Host PCIe Topology for Peer Memory Direct	8
1.4 Quick Start Guide and Document Overview	9
Chapter 2: Peer Memory Direct Configuration with BCM957608	11
2.1 AMD Instinct™ MI300 Series Accelerators	11
2.1.1 ROCm Installation	11
2.1.1.1 Example Instructions for Ubuntu	11
2.1.1.2 Example Instructions for RHEL	11
2.1.1.3 Example Instructions for SLES	11
2.2 Broadcom Ethernet NIC Software Installation with Peer Memory Direct	11
2.2.1 Using the Broadcom NIC_Wizard to Update Software and Firmware for Peer Memory Direct	12
2.2.1.1 Example On Using the NIC Wizard	14
2.2.1.2 Verifying the Correct Driver and Firmware Versions	14
2.2.1.3 Verifying the Correct RoCE QOS Configuration	15
2.2.1.4 Using the Broadcom NIC_Wizard on a Host with Multiple NICs	16
2.2.2 DKMS packages for Peer Memory Direct	17
2.2.2.1 Moving from Kernel with built in ib_peer_mem to a Kernel with no built in ib_peer_mem	17
2.2.3 Manually Compiling the Broadcom Host Software from Source Code for Peer Memory Direct	19
2.2.3.1 Installing the RoCE QOS Configuration (bnxt_re_conf) pkg Manually	19
2.2.3.2 Installing the NIC Firmware Manually	20
2.2.3.3 Verifying the Correct Driver and Firmware Version	20
2.2.4 Configuring RoCE Support	20
2.2.4.1 Enable RDMA Option on the NIC	21
2.2.4.2 Enable RoCE Performance Profile on the NIC	21
2.2.4.3 Enable PCIe Relaxed Ordering on the NIC	21
2.2.4.4 Firmware Based DCBx NVM CFG on NIC	23
2.3 ACS and IOMMU Settings	24
2.3.1 Hosts with AMD CPUs	24
2.3.2 Hosts with Intel CPUs	24
2.3.3 Host Memory	24
2.4 Configuring Routing for the Back-End Network	25
2.4.1 Single Leaf Switch Topology with 24-bit Subnets	25
2.4.1.1 Host 1 netplan file:/etc/netplan/00-installer-config-24bit-subnet-host1.yaml	27
2.4.1.2 Host 2 netplan file:/etc/netplan/00-installer-config-24bit-subnet-host2.yaml	30
2.4.1.3 Ethernet Leaf Switch Port Configuration for 24-bit Subnet Scheme on Dell Z9664 Switch and Supermicro SSE-T8032 Switch Running SONiC OS	33

2.4.1.4 Ethernet Leaf Switch Port Configuration for 24-bit Subnet Scheme on Juniper QFX5240 Switch	37
2.4.2 Single Leaf Switch Topology with 31-bit Subnets	40
2.4.2.1 Host 1 netplan file:/etc/netplan/00-installer-config-host1.yaml	42
2.4.2.2 Host 2 netplan file:/etc/netplan/00-installer-config-host2.yaml	45
2.4.2.3 Ethernet Leaf Switch Port Configuration for 31-bit Subnet Scheme on Dell Z9664 Switch Running SONiC OS.....	49
2.4.2.4 Ethernet Leaf Switch Port Configuration for 31-bit Subnet Scheme on Juniper QFX5240 Switch	52
2.4.3 Confirm Routing Between Different NICs Across Different Hosts.....	54
2.5 Ethernet Switch Configuration for QoS and Congestion Control	55
2.5.1 Example: Arista 7060CX (DCQCN-P at 400G) and 31-bit Subnet Scheme	57
2.5.2 Example: Dell Z9664 Switch and Supermicro SSE-T8032 Switch Running SONiC OS and 31-bit Subnet Scheme.....	58
2.5.3 Example: Juniper QFX5240 Switch and 31-bit Subnet Scheme.....	60
2.6 Final Checks and Settings for Optimal Performance	62
2.7 Installing and Compiling PerfTest with AMD GPU Support	64
2.8 Validating Peer Memory Direct Support with PerfTest.....	65
2.8.1 Using AMD GPU	65
2.8.2 Example – ib_write_bw Test Using Broadcom NIC with AMD GPU	65
Chapter 3: System BIOS	68
3.1 BIOS Setting Recommendations	68
Chapter 4: Atlas2 PCIe Switch Configuration	69
Chapter 5: Debugging Thor2 NIC	70
5.1 Frequently Asked Questions and Troubleshooting.....	70
5.2 BCM_SOSREPORT	73
Chapter 6: Installing AMD GPU Drivers	74
Chapter 7: Debugging AMD Instinct MI300 Series Accelerators	75
Chapter 8: Running RCCL Collectives	76
8.1 Setting Up the Environmental Variable.....	76
8.2 Installing UCX for AMD GPUs	76
8.3 Installing Open MPI for AMD GPUs	77
8.4 Compiling RCCL Tests	77
8.5 Single Node RCCL Collectives	78
8.5.1 Topology and Sample Test Results	78
8.6 Testing Single Node RCCL Collectives Using NICs	79
8.7 MultiNode RCCL Collectives Using Open MPI	80
8.7.1 Prechecks	80
8.7.2 Topology and Sample Test Results	80
8.7.2.1 Test: All-to-All	81
8.7.2.2 Test: All-Reduce	84

8.7.3 Debugging RCCL.....	87
8.7.3.1 RCCL Environment Variable: NCCL_DEBUG	87
8.7.3.2 RCCL Environment Variable: NCCL_SOCKET_IFNAME	87
8.7.3.3 RCCL Environment Variable: NCCL_NET_GDR_LEVEL	87
8.7.3.4 RCCL Environment Variable: NCCL_IB_HCA.....	87

Chapter 1: Introduction

Broadcom[®] Ethernet network interface controllers (NICs) support remote direct memory access (RDMA) over Converged Ethernet (RoCE). RoCE enables Direct Memory Transfer across GPU or CPU memory on two different hosts, bypassing the CPU on the hosts. RoCE is completely offloaded to the NIC hardware. It, therefore, provides high bandwidth, low latency, and low-overhead communication to applications.

RoCE is extensively used in Artificial Intelligence (AI), Machine Learning (ML), and High Performance Computing (HPC) applications. AI/ML and HPC applications follow a distributed and parallel computing paradigm where computations are performed across a large number of GPUs or CPUs spread across a large number of hosts, connected through an Ethernet network. These applications move massive amounts of data across hosts and require high-bandwidth and low-latency transport. RoCE-capable Broadcom NICs provide such a transport, which is completely offloaded to the NIC hardware.

1.1 Intended Audience

This document describes:

- How to use Broadcom NICs and AMD GPUs for [Data Flow Path with Peer Memory Direct](#) on Linux-based hosts.
- How to configure Ethernet switches for RoCE/Peer Memory Direct
- How to run benchmark tests with collective communications libraries such as RCCL.

The intended audience of this document are those looking to deploy AI/ML clusters using Linux-based hosts over an Ethernet network and then run GPU-based collectives and training/inference models on the cluster.

Specifically, this document focuses on the use of Broadcom 400G BCM957608 NICs and AMD Instinct MI300X GPUs in a clustered environment over an Ethernet network. The cluster can consist of multiple hosts and multiple Ethernet switches. Each host contains multiple NICs and multiple GPUs.

The document provides details on how to:

- Install and Configure Software and Firmware for Broadcom NICs
- Install GPU Software:
 - ROCm and RCCL for AMD GPUs
- Configure routing on the hosts for RoCE/Peer Mem Direct
- Configure Ethernet switches for RoCE/Peer Mem Direct
- Run [RDMA perftest](#) with ROCm support on AMD GPUs and Broadcom NICs
- Install OpenMPI and UCX with ROCm support
- Run RCCL collectives on AMD GPUs and Broadcom NICs

For more information on AMD ROCm and AMD RCCL, see the following links:

- ROCm: <https://rocm.docs.amd.com/en/latest/rocm.html>
- RCCL: <https://rocm.docs.amd.com/projects/rccl/en/latest/>

AMD GPU-related tests mentioned in this document have been verified on:

- Ubuntu 22.04 running 5.15 kernel.

The Broadcom BCM957608 (Thor2) family of NICs support RoCE and Peer Memory Direct. The BCM957608 family supports a max speed of 400Gbps. These NICs are available in the PCIe and the OCP3.0 Form Factor. [Table 1](#) provides a list of Broadcom Thor2 NIC part numbers.

Table 1: Broadcom 400G NIC Part Numbers

Part Number	Form Factor	Ports	Connector
BCM957608-P1400GD	PCIe	1x 400G	QSFP112-DD
BCM957608-N1400GD	OCP3.0	1x 400G	QSFP112-DD
BCM957608-P2200G	PCIe	2x 200G (default) Can be configured as 1x400G	QSFP112
BCM957608-N2200G	OCP3.0	2x 200G (default) Can be configured as 1x400G	QSFP112

1.2 Data Flow Path with Peer Memory Direct

AI/ML training and inference models require a large number of GPUs for computation and consume massive amounts of data. These GPUs are spread across several hosts in a cluster and connected via Ethernet NICs and Ethernet switches. Using the Peer Memory Direct feature, which is based on RoCE, GPUs on different hosts can exchange data from each other's GPU memory without any CPU involvement.

Without Peer Memory Direct, RoCE can still be used to transfer data across CPU memory on different hosts without any CPU involvement, but the CPU would then have to transfer the data from its memory to the GPU memory. Peer Memory Direct makes use of PCIe peer-to-peer transfers to transfer data between the NIC and the GPU directly, bypassing the CPU.

Figure 1: Data Flow Path with and without Peer Memory Direct

1.3 Host PCIe Topology for Peer Memory Direct

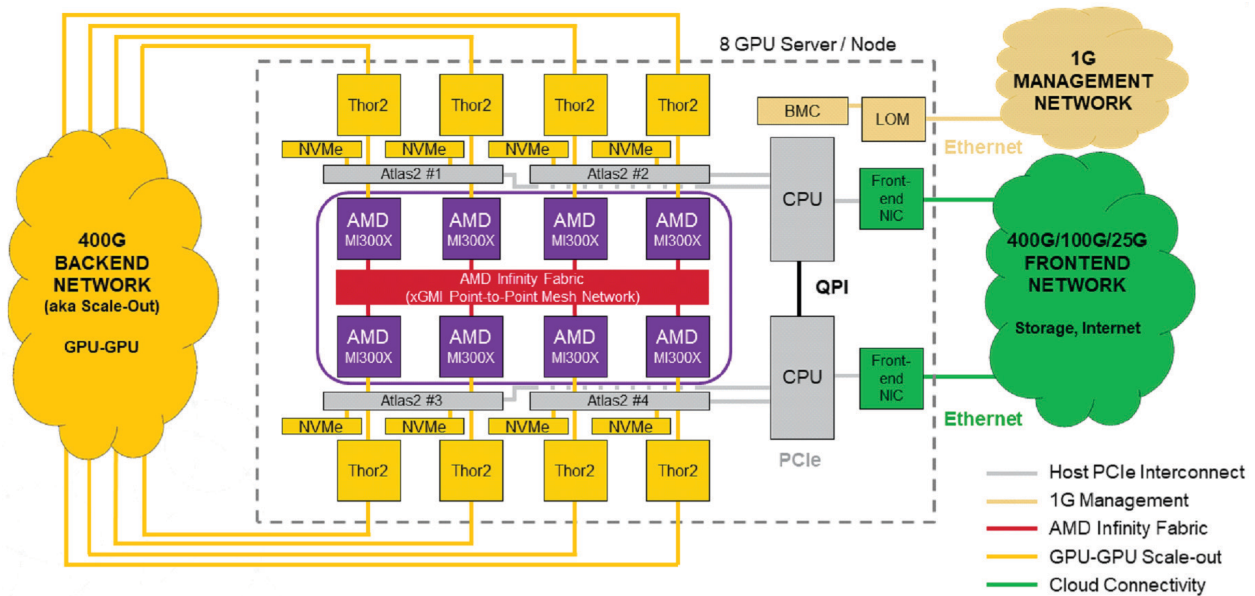

To get the best performance for Peer Memory Direct, the PCIe slot selection for the GPU and the NIC on a host is essential. Peer Memory Direct works via PCIe peer-to-peer transfers, where data is directly transferred between the GPU and the NIC over the PCIe bus.

A typical host used in AI/ML clusters has multiple NICs, multiple GPUs, and multiple PCIe switches per host.

For PCIe peer-to-peer transfers to work, the GPU and the NIC should be connected to the same PCIe switch and the PCIe Access Control Service (ACS) should be disabled on the PCIe switch. If this is not true, then the data is transferred across the NIC and the GPU via the CPU root complex and the benefit of Peer Memory Direct is lost.

A typical NIC, GPU, and PCIe switch configuration inside an AI/ML host is shown in Figure 2. In this host, there are eight NICs (Thor2), eight GPUs (MI300X), and four PCIe switches (Atlas2). Each NIC is paired with a GPU, and two NICs and two GPUs share a PCIe switch.

Figure 2: Typical NIC, GPU, and PCIe Switch Configuration Inside a AI/ML Host

1.4 Quick Start Guide and Document Overview

This user guide summarizes the essential steps for configuring Broadcom BCM957608 NICs and AMD MI300X GPUs for Peer Memory Direct on Linux-based hosts, as described in this document.

IMPORTANT: Always perform [Final Checks and Settings for Optimal Performance](#) to ensure the installation and configuration is correct.

1. Follow the [ROCm Installation](#) instructions by downloading and installing the latest ROCm release.
2. Install the Broadcom Ethernet NIC software and firmware as follows:
 - a. Follow the [Using the Broadcom NIC_Wizard to Update Software and Firmware for Peer Memory Direct](#) instructions (Recommended). Use the -g option to install the Peer Memory Direct drivers.

Example: Using PCIe BDF sudo bash ./install.sh -v -i 1d:00.0 -f -g or ./nic_wizard installer install -v -i 1d:00.0 -f -g

Replaced 1d:00.0 with the actual BDF.

- b. Follow the [Manually Compiling the Broadcom Host Software from Source Code for Peer Memory Direct](#) instructions (Alternative):

If the `nic_wizard` installer cannot be used, manually compile, install, and configure the following:

- Ethernet driver
- RoCE driver and library
- Peer Memory Direct driver
- RoCE QOS Configuration package
- NIC firmware

3. Configure the host and switch settings for Peer Memory Direct as follows:
 - a. To disable PCIe ACS, follow the [Broadcom Ethernet NIC Software Installation with Peer Memory Direct](#) instructions by ensuring that the PCIe Access Control Service (ACS) is disabled on the PCIe switch connecting the NIC and the GPU for optimal performance. A script for disabling ACS is provided in [Appendix C, Script for Disabling ACS](#).
 - b. To configure IOMMU by disabling IOMMU or set it to Pass Through (PT) mode via the kernel command line or BIOS for optimal performance, follow the [Broadcom Ethernet NIC Software Installation with Peer Memory Direct](#) instructions.
 - c. Configure Routing for Backend Network by configuring a routing scheme (using [Configuring Routing for the Back-End Network](#)), such as using 24-bit or 31-bit subnets, to avoid the ARP flux problem when a host has multiple NICs in the same IP subnet.
 - d. To configure Ethernet Switch for QoS and Congestion Control follow the [Ethernet Switch Configuration for QoS and Congestion Control](#) instructions by configuring the switch for Priority Flow Control (PFC) and DCQCN-P Congestion Control, ensuring settings match those on the NICs. The default values are:
 - RoCE v2 packets use DSCP 26 and Priority 3.
 - CNP packets use DSCP 48 and Priority 7.
 - PFC should be enabled for Priority 3 traffic.
4. Perform final checks to ensure that the software, the firmware, the tools, and other settings are configured correctly for optimal Peer Memory Direct performance by using the instructions in [Final Checks and Settings for Optimal Performance](#).
5. Validate Peer Memory Direct Support using the following steps:
 - a. [Installing and Compiling Perfest with AMD GPU Support](#): Clone the perfest repository and compile it with ROCm support.

- b. [Validating Peer Memory Direct Support with Perfest](#): Execute an `ib_write_bw` test to validate Peer Memory Direct.

Chapter 2: Peer Memory Direct Configuration with BCM957608

This section provides configuration information for Peer Memory Direct with the BCM957608.

2.1 AMD Instinct™ MI300 Series Accelerators

This section provides information on configuring the BCM957608 with AMD Instinct MI300 Series Accelerators.

2.1.1 ROCm Installation

Use the instructions provided at: <https://rocm.docs.amd.com/en/latest/> and pick the latest ROCm release shown in [Table 3](#).

For the example in this guide, we will be using ROCm v7.1.0 and the AMD GPU installer method. Instructions are available at: <https://rocm.docs.amd.com/projects/install-on-linux/en/docs-7.1.0/install/quick-start.html>

The installation of the ROCm, as described in this section, installs ROCm, RCCL, and the AMDGPU driver on the host.

2.1.1.1 Example Instructions for Ubuntu

See the example instructions available at:

<https://rocm.docs.amd.com/projects/install-on-linux/en/docs-7.1.0/install/install-methods/package-manager/package-manager-ubuntu.html>

2.1.1.2 Example Instructions for RHEL

See the example instructions available at:

<https://rocm.docs.amd.com/projects/install-on-linux/en/docs-7.1.0/install/install-methods/package-manager/package-manager-rhel.html>

2.1.1.3 Example Instructions for SLES

See the example instructions available at:

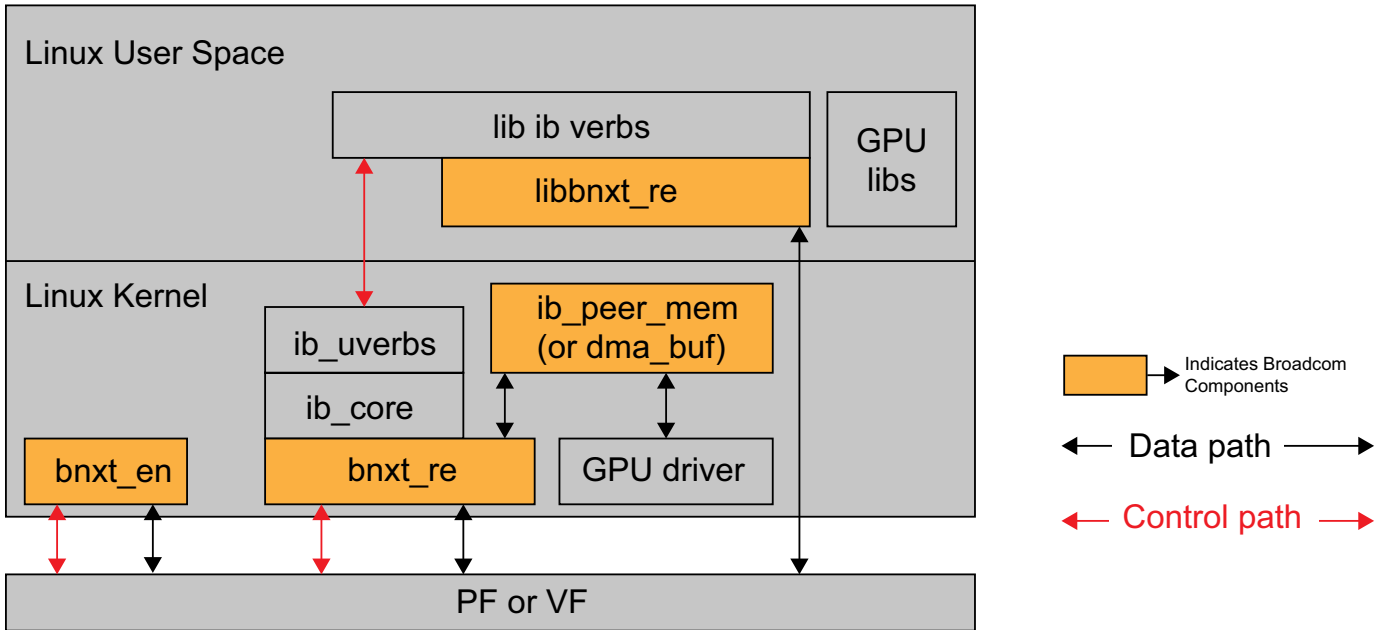

<https://rocm.docs.amd.com/projects/install-on-linux/en/docs-7.1.0/install/install-methods/package-manager/package-manager-sles.html>

2.2 Broadcom Ethernet NIC Software Installation with Peer Memory Direct

The host software components required for Broadcom RoCE are as follows:

- Ethernet kernel driver (`bnxt_en`)
- RoCE kernel driver (`bnxt_re`)
- RoCE userspace library (`libbnxt_re`)
- RoCE QOS configuration pkg (`bnxt_re_conf`)

For Peer Memory Direct, an additional kernel driver (`ib_peer_mem`) is required. The `ib_peer_mem` driver interfaces with the GPU driver for Peer Memory Direct.

The Broadcom Ethernet NIC software can be distributed and installed in a variety of approaches:

- Automated installer: Installs all required software and firmware using a single command line
- Dynamic Kernel Module Support (DKMS) format for the kernel drivers
- Source RPM and Binary RPM format for the kernel drivers
- Source Code for the kernel drivers and the RoCE userspace library
- Debian, RPM, and Source Tarball for `bnxt_re_conf` (udev rules and scripts for setting up RoCE QoS parameters – PFC, CC, RoCE and CNP DSCP values, and so forth)

2.2.1 Using the Broadcom NIC_Wizard to Update Software and Firmware for Peer Memory Direct

Broadcom provides a tarball for every NIC GA release. The release tarball contains all required software and firmware for every NIC part number, and an automated installer that can be used to install the required software and firmware.

The tarball for the latest GA release is publicly available from the downloads tab of the following links:

<https://www.broadcom.com/products/ethernet-connectivity/network-adapters/p1400g>

or

<https://www.broadcom.com/products/ethernet-connectivity/network-adapters/p2200g>

Besides the public location, customers can contact Broadcom for the GA version of any release not available on the public website.

In `NIC_Wizard`, the installer namespace provides different install options including assigning an IP address, netmask, and MTU size for an Ethernet interface. The installer requires Internet access to download any prerequisite packages from the Linux distribution's package manager for building the required NIC host software.

Installer Options

```

-h, --help show this help message and exit
-v, --verbose Show all commands run and status information
-U, --uninstall Uninstall packages and boot-time configuration of the specified devices (-i)
-i DEVICES [DEVICES ...]
Specify a network interface. PCI addresses or interface names ( ens4f1np1,eno1np0,eno2np1,ens4f0np0
)are allowed. Supports comma-separated
values for multiple interfaces. syntax: -i <intf1>,<intf2>
-A, --all Apply on all supported network interfaces. All interface names (
ens4f1np1,eno1np0,eno2np1,ens4f0np0 )are selected.
-a IP_ADDRESS [IP_ADDRESS ...]
Specify an IPv4 or IPv6 IP address for the previous interface
-n NETMASK [NETMASK ...]
Specify the netmask/prefix for the previous interface. For IPv4: dotted decimal (e.g., 255.255.255.0)
or CIDR (e.g., 24). For IPv6: prefix
length (e.g., 64). Default IPv4: 255.255.255.0, Default IPv6: 64. syntax: -a <address> -n
<netmask/prefix>
-l IP_ADDRESS_PREFIX Configure interface IP address as <prefix>. For IPv4: first 3 octets (e.g.,
"192.168.1"). For IPv6: network prefix, first 4 hexets (e.g.,
"2001:db8::", "fd00:1234:5678::"). Supports comma-separated values for multiple interfaces. syntax:
-i <intf1>,<intf2> -l <prefix1>,<prefix2>
-m MTU, --mtu MTU Interface MTU. Default: 1500. syntax: -i <interface name> ( -a <address> or -l
<ip_prefix> ) -m <MTU>
-w, --no-firmware Do not install firmware
-s RELEASE_SOURCE, --source RELEASE_SOURCE
Path to release files. Default: ../
-o {ECN,PFC,ECNPFC,NOOP} [{ECN,PFC,ECNPFC,NOOP} ...], --cc_mode {ECN,PFC,ECNPFC,NOOP}
[{ECN,PFC,ECNPFC,NOOP} ...]
RoCE congestion control mode. Default: NOOP
-r ROCE_PRI, --roce_pri ROCE_PRI
RoCE priority. Must set -o to take effect. Default: 3
-d ROCE_DSCP, --roce_dscp ROCE_DSCP
RoCE Packet DSCP value. Must set -o to take effect. Default: 26
-c CNP_PRI, --cnp_pri CNP_PRI
RoCE CNP Packet Priority. Must set -o to take effect. Default: 7
-p CNP_DSCP, --cnp_dscp CNP_DSCP
RoCE CNP DSCP value. Must set -o to take effect. Default: 48
-b ROCE_PCT, --roce_pct ROCE_PCT
RoCE Bandwidth

```

The installer README.md is located inside the release zip file in the directory: For 234: `utils/linux_installer`. For 237: `utils/nic_wizard`. The README provides info on the different installer options.

The following example shows how to use the installer for the NIC 237 GA release.

The main option used by the installer is "-i" which refers to the interface on which the software and firmware must be installed. The interface argument can be specified either as:

- Ethernet interface name
- BDF (Bus, Device, Function) of the PCIe interface for the NIC

The PCIe BDF is useful in cases when no Broadcom Ethernet driver (`bnxt_en`) exists on a host and therefore the NIC interface does not have a name.

The `-g` option of the installer is used to install Peer Memory Direct drivers.

NOTE: If kernel stack already supports peer memory APIs, the installer skips installing the Broadcom peer memory module.

2.2.1.1 Example On Using the NIC Wizard

```
cd $HOME

# Download the tarball

BCM_TARBALL=bcm_234.1.124.0b.tar.gz or BCM_TARBALL=bcm_237.1.148.0a.tar.gz.
# Highlighted item will change depending on the release

tar -xf ${BCM_TARBALL}

For 234 build:
cd $HOME/bcm_234.1.124.0b/Utils/linux_installer
For 237 build:
cd $HOME/bcm_237.1.148.0a/Utils/nic_wizard

./install.sh -v -i 1d:00.0 -f -g or ./nic_wizard installer install -v -i 1d:00.0 -f -g
# Highlighted item will change depending on PCIe BDF of the NIC (check with lspci)
```

2.2.1.2 Verifying the Correct Driver and Firmware Versions

The output of the `nic_wizard` installer `install` command is logged in the file `install.log`. The log file can be checked to see if any error occurred during the installation. After the installer has completed successfully, the version of the drivers loaded in the kernel and the version of the firmware flashed on the NIC should be checked. The best way to check the version of the drivers loaded into the kernel is to check the `dmesg` logs using the following commands:

```
sudo dmesg | grep -i bnx | grep -i ver

modinfo bnxt_en | grep -i ver

modinfo bnxt_re | grep -i ver

modinfo ib_peer_mem | grep -i ver

dkms status
```

The firmware and driver version installed on the server can be checked with `nic_wizard` as follows:

```
./nic_wizard diag roceanalyzer -s
```

This command lists all the installed software packages and their versions.

The firmware version running on the card can be checked via the Broadcom-provided `NICCLI` tool.

```
sudo niccli --list_devices
# This command will list available Broadcom NICs and index for each

sudo niccli --dev <index | pci b:d:f | mac | nic interface> show -p
# Highlighted item will change depending on the index or PCIe BDF or MAC

# Example:
```

```
sudo niccli --dev 1 show -p
```

In general, reboot the host after the installer has run and re-check the driver version and the FW version. This ensures the correct version of the drivers load after every reboot of the host and the initramfs/ramdisk of the host is correctly updated by the installer.

2.2.1.3 Verifying the Correct RoCE QOS Configuration

The correct RoCE QOS CFG pkg (bnxt_re_conf) installation can be verified via the presence of the /etc/bnxt_re/bnxt_re.conf file. The file contents should match the configured QOS values. The default values are as follows:

```
cat /etc/bnxt_re/bnxt_re.conf
ENABLE_FC=1
FC_MODE=3
ROCE_PRI=3
ROCE_DSCP=26
CNP_PRI=7
CNP_DSCP=48
ROCE_BW=50
UTILITY=4
```

The correct RoCE QOS application on each RoCE NIC can be verified via the following Broadcom-provided NICCLI tool commands:

```
sudo niccli --list_devices
# This command will list available Broadcom NICs and index for each

sudo niccli --dev <index | pci b:d:f | mac> qos --ets --show
# Highlighted item will change depending on the index or PCIE BDF or MAC

# Example:
sudo niccli --dev 1 qos --ets --show

IEEE 8021QAZ ETS Configuration TLV:
    PRIO_MAP: 0:0 1:0 2:0 3:1 4:0 5:0 6:0 7:2
    TC Bandwidth: 50% 50% 0%
    TSA_MAP: 0:ets 1:ets 2:strict
IEEE 8021QAZ PFC TLV:
    PFC enabled: 3
IEEE 8021QAZ APP TLV:
    APP#0:
        Priority: 7
        Sel: 5
        DSCP: 48

    APP#1:
        Priority: 3
        Sel: 5
        DSCP: 26

    APP#2:
        Priority: 3
        Sel: 3
        UDP or DCCP: 4791
```

```
TC Rate Limit: 100% 100% 100% 0% 0% 0% 0% 0%
```

Use the following roceanalyzer command to verify the QoS configurations:

```
./nic_wizard diag roceanalyzer -q
```

NOTE: If `roceConfigFile` exists with `OVERRIDE=1`, that file drives expected QoS values; otherwise expectations match `/usr/bin/bnxt_re_conf.sh`.

In general, reboot the host after the installer has run and re-check the driver version, the firmware version, and the RoCE QOS settings. This ensures the correct version of the drivers load after every reboot of the host and the `initramfs/ramdisk` of the host is correctly updated by the installer.

2.2.1.4 Using the Broadcom NIC_Wizard on a Host with Multiple NICs

Most of the hosts used for Peer Memory Direct use multiple NICs and multiple GPUs per host. From the NIC perspective, a single host driver instance is interfacing with the firmware on all the NICs. To flash or upgrade firmware on multiple NICs on the same host, the installer supports specifying multiple interfaces or multiple PCIe Bus, Device, Function. Each interface or PCIe Bus, Device, Function specifies a NIC on which the firmware is to be flashed.

```
cd $HOME
```

```
ls bcm_234.1.124.0b.tar.gz
```

```
# Highlighted item will change depending on the release
```

```
tar xf bcm_234.1.124.0b.tar.gz
```

```
# Highlighted item will change depending on the release
```

```
cd $HOME/bcm_234.1.124.0b/Utils/linux_installer
```

For 234 build:

```
cd $HOME/bcm_234.1.124.0b/Utils/linux_installer
```

For 237 build:

```
cd $HOME/bcm_237.1.148.0a/Utils/nic_wizard
```

```
# Highlighted item will change depending on the release
```

```
sudo bash ./install.sh -v -i 1d:00.0 -i 43:0.0 -i 56:0.0 -i 69:0.0 -i 9f:0.0 -i c3:0.0 -i d5:0.0 -i e7:0.0 -f -g
```

(or)

```
./nic_wizard installer install -v -i 1d:00.0 -i 43:0.0 -i 56:0.0 -i 69:0.0 -i 9f:0.0 -i c3:0.0 -i d5:0.0 -i e7:0.0 -f -g
```

(or)

To select all of the supported NICs:

```
./nic_wizard installer install -A -f -g
```

```
# Highlighted items will change depending on the PCIe BDF of each NIC
```

Reboot the host and check the driver versions and the firmware versions on each NIC as described in [Verifying the Correct Driver and Firmware Versions](#).

2.2.2 DKMS packages for Peer Memory Direct

If the NIC wizard or the NIC installer is used to install drivers on a host using the `-g` option, the installer automatically chooses the correct DKMS pkg (`netxtreme-peer-mem`) if it thinks using DKMS is appropriate. The NIC release tarball contains DKMS packages for the kernel drivers. Several DKMS packages exist as part of the release inside the `drivers_linux` directory as follows:

```
drivers_linux/peer_mem/dkms/netxtreme-peer-mem-dkms_234.0.154.0_all.deb
drivers_linux/peer_mem/dkms/netxtreme-peer-mem-234.0.154.0-1dkms.noarch.rpm
```

```
drivers_linux/bnxt_en/dkms/bnxt-en-dkms_1.10.3.234.0.154.0_all.deb
drivers_linux/bnxt_en/dkms/bnxt_en-1.10.3.234.0.154.0-1dkms.noarch.rpm
```

```
drivers_linux/bnxt_re/dkms/bnxt-re-dkms_234.0.154.0_all.deb
drivers_linux/bnxt_re/dkms/bnxt_re-234.0.154.0-1dkms.noarch.rpm
```

For Peer Memory Direct, installing only the `netxtreme-peer-mem` DKMS is sufficient as this DKMS contains the kernel modules for `bnxt_en`, `bnxt_re`, and `ib_peer_mem` drivers. Furthermore, the configuration file of the `netxtreme-peer-mem` DKMS checks if `ib_peer_mem` is built into the kernel. It installs the `ib_peer_mem` module only if `ib_peer_mem` is not built into the kernel. It is also necessary that if the `netxtreme-peer-mem` DKMS is installed, `bnxt_en` DKMS and `bnxt_re` DKMS are removed as they are redundant and may interfere with the correct working of Peer Memory Direct. Use the `dkms status` command to check which DKMS pkgs are installed. Remove `bnxt_en` DKMS and `bnxt_re` DKMS if they are installed in addition to the `netxtreme-peer-mem` DKMS and reboot the host as shown in [Moving from Kernel with built in `ib_peer_mem` to a Kernel with no built in `ib_peer_mem`](#).

The use of `netxtreme-peer-mem` DKMS is recommended as this DKMS installs all the required drivers on a host. To summarize, the `netxtreme-peer-mem` DKMS installs the following drivers automatically.

For kernels with no built in `ib_peer_mem`:

- `bnxt_en`
- `bnxt_re`
- `ib_peer_mem`

For kernels with built in `ib_peer_mem`:

- `bnxt_en`
- `bnxt_re`

2.2.2.1 Moving from Kernel with built in `ib_peer_mem` to a Kernel with no built in `ib_peer_mem`

Certain older kernels, for example Ubuntu 22.04 (5.14 kernels) have `ib_peer_mem` built into the kernel. Newer kernels, for example Ubuntu 22.04 (6.8 kernels) have dropped built-in `ib_peer_mem`. See [Frequently Asked Questions and Troubleshooting](#) for information on how to check if `ib_peer_mem` is built into the kernel or not.

For kernels with builtin `ib_peer_mem`, having the `bnxt_en` and `bnxt_re` drivers alone is sufficient for Peer Memory Direct to work. If a kernel is upgraded such that `ib_peer_mem` is no longer built into the kernel, the `ib_peer_mem` module is required for Peer Memory Direct. In such cases, if `bnxt_en` and `bnxt_re` drivers are present on a host via DKMS, the DKMS files have to be removed and `netxtreme-peer-mem` DKMS has to be installed. The `netxtreme-peer-mem` DKMS contains `bnxt_en`, `bnxt_re` and `ib_peer_mem` kernel modules.

Check which DKMS packages are installed on the host. It is incorrect to have `bnxt_en` and `bnxt_re` along with `netxtreme-peer-mem`:

Example:

```
dkms status
```

```
bnxt_en/1.10.3.234.0.171.0, 6.8.0-111-generic, x86_64: installed  
bnxt_re/234.0.171.0, 6.8.0-111-generic, x86_64: installed  
netxtreme-peer-mem/234.0.154.0, 6.8.0-111-generic, x86_64: installed
```

Remove `bnxt_en` and `bnxt_re` DKMS:

Example:

```
dkms remove bnxt_en/1.10.3.234.0.171.0 --all  
dkms remove bnxt_re/234.0.171.0 --all
```

Check status again to make sure the DKMS are removed:

Example:

```
dkms status
netxtreme-peer-mem/234.0.154.0, 6.8.0-111-generic, x86_64: installed

reboot
```

Another option is to use the NIC installer to uninstall the installed drivers and then run the NIC installer with the `-g` option to install the correct drivers. With either of the options above, please verify the correct version of the drivers load after a reboot. Please refer to instructions in [Verifying the Correct Driver and Firmware Versions](#).

2.2.3 Manually Compiling the Broadcom Host Software from Source Code for Peer Memory Direct

The NIC Wizard installer automatically installs the peer mem driver required for the NIC if the driver is not available as part of the kernel. Check [Frequently Asked Questions and Troubleshooting](#) on how to check if the peer mem driver is already part of the kernel. This section outlines the manual compilation of the peer mem driver if a user wants to manually compile the peer mem driver.

The source code required for the kernel drivers is distributed in a tarball with a name that indicates the software release the tarball belongs to. For example, the tarball `netxtreme-peer-mem-a.b.c.d.tar.gz` contains all the kernel driver source code and Makefiles to build the `a.b.c.d` release version of the kernel drivers.

The source code for the `libbnxt_re` library is distributed in a tarball with a name that indicates the software release the tarball belongs to. For example, the `libbnxt_re-234.0.154.0.tar.gz` contains all the software source code and Makefiles to build the 234.0.154.0 release version of the `libbnxt_re` library.

To summarize, the following two source code tarballs are required to be built and installed for the NIC software on any given host:

- `netxtreme-peer-mem-a.b.c.d.tar.gz`
- `libbnxt_re-a.b.c.d.tar.gz`

The highlighted items change depending on the release version.

[Appendix A, Compiling Broadcom NIC Software from Source](#) provides Linux shell scripts that can be used to build and install the required software. Two separate scripts are provided for Ubuntu and RHEL-based hosts. The script, along with `netxtreme-peer-mem-a.b.c.d.tar.gz` and `libbnxt_re-a.b.c.d.tar.gz` should be placed in a directory before executing the script. The content of the scripts can be followed to understand the various steps used to build and install the NIC software.

2.2.3.1 Installing the RoCE QOS Configuration (`bnxt_re_conf`) pkg Manually

NOTE: If the Broadcom automated installer is used, then the RoCE QOS Configuration pkg (`bnxt_re_conf`) is automatically installed by the `nic_wizard` when using the `install` command.

Beginning with the Broadcom 2.31 release, the RoCE QOS CFG package is a standalone pkg. Before the 2.31 release, RoCE QOS CFG was part of the RoCE driver `bnxt_re`. The `bnxt_re_conf` pkg is distributed in a variety of formats (debian, RPM, and source tarball). Depending on the OS distro being used, the appropriate pkg format can be used.

```
cd $HOME
ls bcm_234.1.124.0b.tar.gz
```

```
# Highlighted item will change depending on the release

tar xf bcm_234.1.124.0b.tar.gz
# Highlighted item will change depending on the release

cd $HOME/bcm_234.1.124.0b.tar.gz/drivers_linux/bnxt_re/bnxt_re_conf
# Highlighted item will change depending on the release

dpkg -i bnxt_re_conf_234.0.154.0-1_all.deb
# Highlighted item will change depending on the release
or
rpm -Uvh bnxt_re_conf-234.0.154.0-1.noarch.rpm
# Highlighted item will change depending on the release
```

It is recommended to reboot the host if the `bnxt_re_conf` pkg is installed the first time or the contents of the `/etc/bnxt_re/bnxt_re.conf` file are modified. This allows the RoCE QOS settings to be applied correctly to each NIC. After installing the `bnxt_re_conf` pkg, ensure the pkg is correctly installed as shown in [Verifying the Correct RoCE QOS Configuration](#).

2.2.3.2 Installing the NIC Firmware Manually

NOTE: If the Broadcom `nic_wizard` is used, then the firmware is automatically installed by the installer.

The Broadcom NIC firmware is provided in a ".pkg" file and a single file contains all the required firmware for a NIC. The firmware pkg file name contains the NIC part number.

For example, the BCM957608-P1400GD card firmware file is named `BCM957608-P1400GDF00.pkg`.

To list the interface name of all the Broadcom NICs available on a host, use the NICCLI tool provided by Broadcom.

```
sudo niccli --list_devices
# List the interfaces where Broadcom Ethernet cards are recognized
```

To install the FW on a Broadcom NIC, use the following NICCLI command:

```
sudo niccli --dev <index | pci b:d:f | mac> fw --update -f <FW.pkg> --yes
# Highlighted item will change depending on the index or PCIe BDF or MAC
```

```
# Example:
sudo niccli --dev 1 install BCM957608-P1400GQF00.pkg
```

A reboot is required when a NIC firmware is flashed. The NICCLI tool output indicates a reboot is required.

2.2.3.3 Verifying the Correct Driver and Firmware Version

After manually installing the drivers from source code and/or installing the NIC firmware on a NIC, it's a good idea to check and ensure the proper versions of the driver are loaded into the kernel and the correct firmware version is installed on the NICs. See [Verifying the Correct Driver and Firmware Versions](#) for the required steps.

2.2.4 Configuring RoCE Support

The NICs are default configured for RoCE/Peer Memory Direct. The following NVM CFG parameters control RoCE operation on an NIC and can be verified using the NICCLI tool.

2.2.4.1 Enable RDMA Option on the NIC

To check the option value:

```
sudo niccli --dev <index|pci b:d:f> nvm --getoption support_rdma --scope <pf number>
# First highlighted item will change depending on the index or PCIe BDF or MAC
# Second highlighted item will change depending on the PF
```

Example:

```
sudo niccli --dev 1 nvm --getoption support_rdma --scope 0
```

To enable the option:

```
sudo niccli --dev <index|pci b:d:f> nvm --setoption support_rdma --scope <pf number> --value 1
# First highlighted item will change depending on the index or PCIe BDF or MAC
# Second highlighted item will change depending on the PF
```

Example:

```
sudo niccli --dev 1 nvm --setoption support_rdma --scope 0 --value 1
```

2.2.4.2 Enable RoCE Performance Profile on the NIC

The default performance profile on the NICs is non-ROCE. The default profile is optimized for scenarios where the majority of the traffic handled by the NIC is L2. If the NIC needs to handle a traffic mix where the RoCE traffic is greater than 50% of all traffic (as would be the case for Peer Memory Direct), then the performance profile should be changed to RoCE.

To check the option value:

```
sudo niccli --dev <index | pci b:d:f | mac> nvm --getoption performance_profile
# Highlighted item will change depending on the index or PCIe BDF or MAC
```

Example:

```
sudo niccli --dev 1 nvm --getoption performance_profile
```

To enable the option:

```
sudo niccli --dev <index|pci b:d:f> nvm --setoption performance_profile --value 1
# Highlighted item will change depending on the index or PCIe BDF or MAC
#value 0: Default
#value 1: RoCE
```

Example:

```
sudo niccli --dev 1 nvm --setoption performance_profile --value 1
```

2.2.4.3 Enable PCIe Relaxed Ordering on the NIC

PCIe Relaxed ordering allows PCIe transactions to be completed out of order and results in a performance boost for applications when enabled. However, care should be taken before Relaxed ordering is enabled as it can lead to data corruption for some applications.

To check the option value:

```
sudo niccli --dev <index | pci b:d:f | mac> nvm --getoption pcie_relaxed_ordering
# Highlighted item will change depending on the index or PCIe BDF or MAC
```

Example:

```
sudo niccli --dev 1 nvm --getoption pcie_relaxed_ordering
```

To enable the option:

```
sudo niccli --dev <index|pci b:d:f> nvm --setoption pcie_relaxed_ordering --value 1  
# Highlighted item will change depending on the index or PCIe BDF or MAC
```

Example:

```
sudo niccli --dev 1 nvm --setoption pcie_relaxed_ordering --value 1
```

2.2.4.4 Firmware Based DCBx NVM CFG on NIC

The Broadcom RoCE driver (`bnxt_re`) configures the QOS defaults for the NIC upon loading. However, if the firmware-based DCBX or the FW-based LLDP is enabled via NVM CFG, the RoCE driver does not configure the QOS on the NIC interface.

NOTE: Firmware-based DCBX and FW-based LLDP should be disabled if the RoCE driver needs to configure the QOS for the interface.

To check the option values:

```
sudo niccli --dev <index | pci b:d:f | mac> nvm --getoption dcbx_mode --scope <pf number>
# First highlighted item will change depending on the index or PCIe BDF or MAC
# Second highlighted item will change depending on the PF
```

Example:

```
niccli --dev 3 nvm --getoption dcbx_mode --scope 0
```

```
sudo niccli --dev <index | pci b:d:f | mac> nvm --getoption lldp_nearest_bridge --scope <pf number>
# First highlighted item will change depending on the index or PCIe BDF or MAC
# Second highlighted item will change depending on the PF
```

Example:

```
sudo niccli --dev 1 nvm --getoption lldp_nearest_bridge --scope 0
```

```
sudo niccli --dev <index | pci b:d:f | mac> nvm --getoption lldp_nearest_non_tpmr_bridge --scope <pf number>
```

First highlighted item will change depending on the index or PCIe BDF or MAC

Second highlighted item will change depending on the PF

Example:

```
sudo niccli --dev 1 nvm --getoption lldp_nearest_non_tpmr_bridge --scope 0
```

To disable the options:

```
sudo niccli --dev <index | pci b:d:f | mac> nvm --setoption dcbx_mode --scope <pf number> --value 0
# First highlighted item will change depending on the index or PCIe BDF or MAC
# Second highlighted item will change depending on the PF
```

Example:

```
$ sudo niccli --dev 1 nvm --setoption dcbx_mode --scope 0 --value 0
```

```
$ sudo niccli --dev <index | pci b:d:f | mac> nvm --setoption lldp_nearest_bridge --scope <pf number> --value 0
```

First highlighted item will change depending on the index or PCIe BDF or MAC

Second highlighted item will change depending on the PF

Example:

```
$ sudo niccli --dev 1 nvm --getoption lldp_nearest_bridge --scope 0 --value 0
```

```
$ sudo niccli --dev <index | pci b:d:f | mac> nvm --setoption lldp_nearest_non_tpmr_bridge --scope <pf number> --value 0
```

First highlighted item will change depending on the index or PCIe BDF or MAC

Second highlighted item will change depending on the PF

Example:

```
$ sudo niccli --dev 1 nvm --getoption lldp_nearest_non_tpmr_bridge --scope 0 --value 0
```

Verify the RoCE NVM configuration using the following command:

```
./nic_wizard diag roceanalyzer -n
```

2.3 ACS and IOMMU Settings

For Peer Memory Direct to work optimally, PCIe Access Control Services (ACS) needs to be disabled. ACS is a PCIe switch setting and needs to be disabled on the PCIe switch connecting the NIC and the GPU.

Additionally, for optimum Peer Memory Direct performance, the IOMMU on the host needs to be disabled or put in the Pass Through (PT) mode.

Verify ACS and IOMMU settings using the following command:

```
./nic_wizard diag roceanalyzer -p
```

2.3.1 Hosts with AMD CPUs

The IOMMU should be configured in PT mode via the kernel command line. The kernel parameters to use with AMD CPU-based hosts are `amd_iommu=on iommu=pt`.

Sample kernel command line for hosts with AMD CPU and IOMMU in PT mode:

```
BOOT_IMAGE=/boot/vmlinuz-5.15.0-102-generic root=UUID=8d0ffb16-6f01-44c2-8e16-18bb37d87392 ro  
pci=realloc=off amd_iommu=on iommu=pt
```

2.3.2 Hosts with Intel CPUs

The IOMMU can be configured in PT mode via the kernel command line. The kernel parameters to use with Intel CPU-based hosts are `intel_iommu=on iommu=pt`.

Sample kernel command line for hosts with Intel CPU and IOMMU in PT mode:

```
BOOT_IMAGE=/boot/vmlinuz-5.15.0-102-generic root=UUID=8d0ffb16-6f01-44c2-8e16-18bb37d87392 ro  
pci=realloc=off intel_iommu=on iommu=pt
```

On some hosts, ACS and IOMMU can be disabled via the BIOS as well. Check with the host/BIOS vendor on how ACS and IOMMU can be configured via the BIOS.

See [Appendix C, Script for Disabling ACS](#) for a bash shell script that can be used to disable ACS on a host.

If the host does not support disabling ACS via the BIOS, then ACS must be disabled after every host reboot and the shell script in [Appendix C, Script for Disabling ACS](#) can be used.

2.3.3 Host Memory

AI/ML and HPC applications typically require a lot of RAM. Two Terabytes or more of RAM is typically recommended.

2.4 Configuring Routing for the Back-End Network

Most hosts used for AI/ML training, inference as well as AI/ML applications have multiple NICs and multiple GPUs per host. GPU collectives such as RCCL require that any NIC on any host should be able to communicate with any other NIC on any host in the cluster.

When a host has multiple NICs in the same IP subnet, an Address Resolution Protocol (ARP) flux problem can happen on Linux-based hosts. Linux can respond to an ARP request on a different interface (IP address) than the IP address carried in the ARP request. This causes the RDMA stack to incorrectly map the remote IP address to the wrong RDMA device.

There are a few solutions to this problem.

Using the `arp_ignore` and `arp_announce` `sysctl` settings as follows, one can instruct Linux to send ARP replies on the interface targeted in the ARP request.

```
sudo sysctl -w net.ipv4.conf.all.arp_announce=1
sudo sysctl -w net.ipv4.conf.all.arp_ignore=2
```

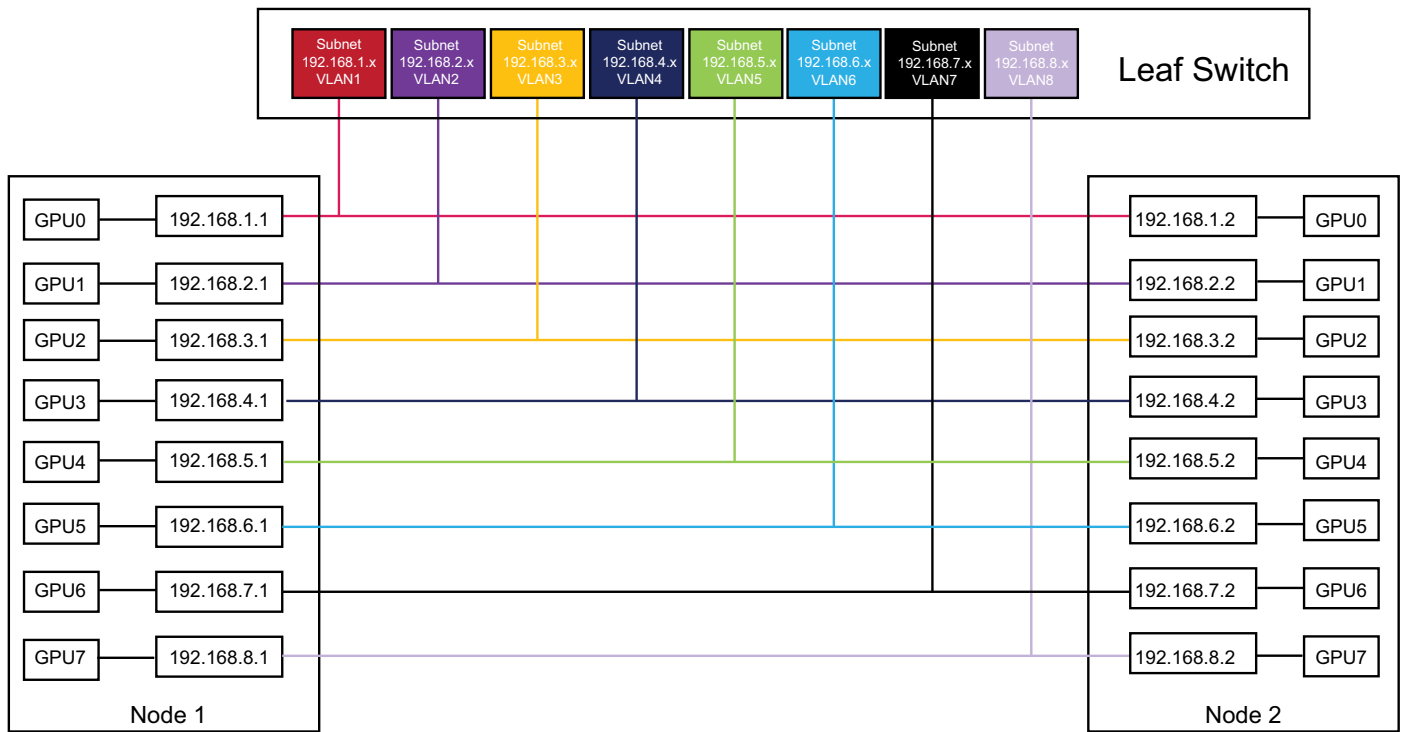

However, a better approach to the ARP flux problem is to configure each NIC on a host in a separate subnet. There are multiple approaches possible here depending on the size of the cluster being configured.

2.4.1 Single Leaf Switch Topology with 24-bit Subnets

The approach used in the section makes use of the 24-bit IP subnets and a Layer 3 switch. The topology referenced in this section is that of multiple hosts connecting to the same leaf switch.

1. Each host has eight NICs and eight GPUs per host.
2. The leaf switch is a Layer 3 switch and can route packets based on the IPv4 address.
3. A total of 8 IP subnets and eight VLANs are used in the network. The VLANs are only configured on the switch ports. The VLANs are not configured on the NICs.
4. Each VLAN on the switch has an IP address assigned in a unique subnet from the set of eight subnets used in the network.
5. Inter VLAN routing is used on the switch.
6. Each of the eight NICs on a host belongs to a unique subnet from the set of eight subnets used in the network. For symmetry, NIC1 on each host is connected to a switch port in the same VLAN, NIC2 on each host is connected to a switch port in the same VLAN, and so on.
7. Source-Based Routing is applied to each NIC, with the default gateway set to the IP address of the switch port VLAN to which the NIC is connected. A total of eight additional routing tables (101 through 108) are used.

Figure 3: 24-bit Subnet Scheme

The following is a sample netplan file for two of the hosts on the cluster. Other hosts can follow a similar addressing scheme.

The netplan file has 8 Ethernet interfaces. The interfaces are named eth1 through eth8 just for reference and should be replaced with the actual interface Ethernet names on the host. Each interface has an IP address with a 24-bit subnet mask.

2.4.1.1 Host 1 netplan file:/etc/netplan/00-installer-config-24bit-subnet-host1.yaml

```
network:
  version: 2
  renderer: networkd
  ethernets: eth1:
    mtu: 9000
    addresses:
      - 192.168.1.1/24
    routes:
      - to: default
        via: 192.168.1.254
        table: 101
    routing-policy:
      - from: 192.168.1.1
        table: 101
  eth2:
    mtu: 9000
    addresses:
- 192.168.2.1/24
    routes:
      - to: default
        via: 192.168.2.254
        table: 102
    routing-policy:
      - from: 192.168.2.1
        table: 102
  eth3:
    mtu: 9000
    addresses:
      - 192.168.3.1/24
    routes:
      - to: default
        via: 192.168.3.254

  routes:
  - to: default
    via: 192.168.7.254
    table: 107
  routing-policy:
  - from: 192.168.7.1
    table: 107
eth8:
  mtu: 9000
  addresses:
  - 192.168.8.1/24
  routes:
  - to: default
    via: 192.168.8.254
    table: 108
  routing-policy:
  - from: 192.168.8.1
    table: 108
```

After the previous netplan file is applied, ensure to start and enable networked service. This disables any prior network configuration performed with network manager.

```
sudo systemctl enable systemd-networkd
sudo systemctl start systemd-networkd
```

After the previous netplan file is applied, the `ip rule show` command should list eight additional rules and eight additional routing tables should be populated.

```
$ ip rule show
0:      from all lookup local
32758:  from 192.168.7.1 lookup 107 proto static
32759:  from 192.168.5.1 lookup 105 proto static
32760:  from 192.168.6.1 lookup 106 proto static
32761:  from 192.168.8.1 lookup 108 proto static
32762:  from 192.168.1.1 lookup 101 proto static
32763:  from 192.168.2.1 lookup 102 proto static
32764:  from 192.168.3.1 lookup 103 proto static
32765:  from 192.168.4.1 lookup 104 proto static
32766:  from all lookup main
32767:  from all lookup default
```

```
$ ip route list table 101
default via 192.168.1.254 dev eth1 proto static
```

```
$ ip route list table 102
default via 192.168.2.254 dev eth2 proto static
```

```
$ ip route list table 103
default via 192.168.3.254 dev eth3 proto static

```

After the previous netplan file is applied, ensure to start and enable networked service. This disables any prior network configuration performed with network manager.

```
sudo systemctl enable systemd-networkd
sudo systemctl start systemd-networkd
```

After the previous netplan file is applied, the `ip rule show` command should list eight additional rules and eight additional routing tables should be populated.

```
$ ip rule show
0:      from all lookup local
32758:  from 192.168.7.2 lookup 107 proto static
32759:  from 192.168.5.2 lookup 105 proto static
32760:  from 192.168.6.2 lookup 106 proto static
32761:  from 192.168.8.2 lookup 108 proto static
32762:  from 192.168.1.2 lookup 101 proto static
32763:  from 192.168.2.2 lookup 102 proto static

```

The corresponding sample Ethernet switch configuration with respect to configuring the VLAN, the subnets, and the routing on the switch are shown in the following example. The sample configuration is based on a Dell Z9664 Ethernet switch and a Supermicro SSE-T8032 Ethernet switch running SONiC. Only the configuration pertinent to the routing scheme outlined in this section is presented.

```

2.4.2 Single Leaf Switch Topology with 31-bit Subnets

The approach used in this section makes use of the 31-bit IP subnets and a Layer 3 switch. The 31-bit subnets enable point-to-point links as the 31-bit subnet allows only 2 addresses in the subnet. These two addresses form each end of the point-to-point link.

The topology referenced in this section is that of multiple hosts connecting to the same leaf switch.

1. Each host has eight NICs and eight GPUs per host.
2. Each NIC in the network is in a unique subnet (31-bit subnet mask). The NIC IP address forms one end of the point-to-point connection. The other IP address of the subnet is assigned to the Ethernet switch port to which the NIC connects. The switch port forms the other end of the point-to-point connection.
3. Source Based Routing is used for each NIC where the default gateway of each NIC is the IP address of the switch port to which it connects. A total of eight additional routing tables (101 through 108) are used.

Figure 4: 31-bit Subnet Scheme

The following is a sample netplan file for two of the hosts on the cluster. Other hosts can follow a similar addressing scheme.

The netplan file has eight Ethernet interfaces. The interfaces are named eth1 through eth8 just for reference and should be replaced with the actual interface Ethernet names on the host. Each interface has an IP address with a 31-bit subnet mask.

2.4.2.1 Host 1 netplan file:/etc/netplan/00-installer-config-host1.yaml

    priority: 1
eth8:
  mtu: 9000
  addresses:
  - 1.1.101.85/31
  routes:
  - to: default
    via: 1.1.101.84
    table: 108
    scope: global
  routing-policy:
  - from: 1.1.101.84/31
    table: 108
    priority: 0
  - to: 1.1.101.84/16
    table: 108
    priority: 1

```

After the previous netplan file is applied, ensure to start and enable networked service. This disables any prior network configuration performed with the network manager.

```

sudo systemctl enable systemd-networkd
sudo systemctl start systemd-networkd

```

After the previous netplan file is applied, the `ip rule show` command should list eight additional rules and eight additional routing tables should be populated.

```

$ ip rule show
0:    from all lookup local

The corresponding sample Ethernet switch configuration with respect to configuring the IP addresses and the routing on the switch is shown in the following example. The sample configuration is based on a Dell Z9664 Ethernet switch and a Supermicro SSE-T8032 Ethernet switch running SONiC. Only the configuration pertinent to the routing scheme outlined in this section is presented.

NOTE: The following example uses a port scheme where the different NICs of the same host are connected to the consecutive front panel Ethernet switch ports. However, it's also possible to connect NIC1 of each host to the consecutive front panel switch ports and so on.

2.4.2.3 Ethernet Leaf Switch Port Configuration for 31-bit Subnet Scheme on Dell Z9664 Switch Running SONiC OS

        }
    }
}
}
```

2.4.3 Confirm Routing Between Different NICs Across Different Hosts

With the routing configured in the back-end network as shown in Configuring Host Routing for the Back-end Network, ping and trace route tests can be used to confirm that any NIC on any host can reach any other NIC on any other host.

```
# Example: ping Host1,NIC1 to Host2,NIC7
ping -I 192.168.1.1 192.168.7.2
traceroute -i eth1 192.168.7.2
```

```
# Example: ping Host1,NIC6 to Host2,NIC2
ping -I 192.168.6.1 192.168.2.2
traceroute -i eth6 192.168.2.2
```

All highlighted items above will depend on netplan setup

The routing configuration for backend network can be verified with the following command:

```
./nic_wizard diag roceanalyzer -R.
```

In order to verify the actual configuration with netplan, use the following command:

```
./nic_wizard diag roceanalyzer -R --netplan <path_to_netplan_config_file>
```

The following shell script can be used to test the full mesh ping across all the NICs of two given hosts. The script runs ping tests from each NIC of host1 to each NIC of host2.

```
#!/bin/bash

host1_ip_list=(192.168.1.15 192.168.2.15 192.168.3.15 192.168.4.15 192.168.5.15 192.168.6.15
192.168.7.15 192.168.8.15)

host2_ip_list=(192.168.1.14 192.168.2.14 192.168.3.14 192.168.4.14 192.168.5.14 192.168.6.14
192.168.7.14 192.168.8.15)

for i in ${host1_ip_list[@]}
do
    for j in ${host2_ip_list[@]}
    do
        echo -e "\nping -I $i $j\n=====\n"
        ping -I $i -c 1 $j > /dev/null
        if [ $? == 0 ]; then

            echo "Ping Passed"
        else
            echo -e "Ping Failed\n\n\n"
            exit 5
        fi
    done
done

# All highlighted items above will depend on netplan setup
```

2.5 Ethernet Switch Configuration for QoS and Congestion Control

Every GPU cluster and HPC Cluster has a single or multi-tier Ethernet switch architecture to connect all the NICs on all the hosts in the cluster. With multiple NICs and multiple hosts in the cluster communicating with each other all the time, and flows starting and stopping asynchronously, congestion in the network becomes inevitable. RCCL collectives also involve many-to-many and many-to-one communication patterns leading to congestion on various network paths.

RoCE provides a very high bandwidth and low latency transport, but it is sensitive to packet drops. Any packet drop incurred due to congestion in the switches or the NICs impacts RoCE performance. Therefore, to handle congestion, the NICs and the switches in the cluster need to be configured for Congestion Control.

Broadcom NICs implement the DCQCN-P Congestion Control Algorithm. DCQCN stands for Data Center Quantized Congestion Notification and DCQCN-P stands for DCQCN- Probabilistic. With the NICs using the DCQCN-P Congestion Control Algorithm, the switches in the network need to be configured for DCQCN-P as well.

In simple terms, the DCQCN algorithm relies on the switches marking the ECN field in the IP header of the RoCE v2 packets when the switch buffers rise beyond a configured threshold. The NIC receiving an ECN-marked packet sends a Congestion Notification Packet (CNP) to the NIC that sent the RoCE v2 packet that was ECN marked by the switch. The NIC, upon receiving a CNP regulates its sending rate to alleviate the congestion in the network. An important thing to note is that the Congestion Control Algorithm operates at the RoCE Connection or the RoCE Queue Pair(QP) level, with the RoCE v2 and the CNP packets carrying the QP number in them.

The DCQCN-P algorithm uses the probabilistic ECN marking. In probabilistic marking, minimum and maximum marking thresholds are specified at the switch together with maximum marking probability. When the switch egress port queue crosses the minimum threshold, marking starts at low probability which linearly increases between 0 and max probability in the range between min. and max. marking thresholds. After the maximum threshold is reached, every packet is marked (for example, 100% marking).

Congestion Control Algorithms help with Congestion in the network but do not make the network lossless. Even with Congestion Control configured in the network, packets can be dropped with flows starting asynchronously or due to an incast. To make the network lossless, Priority Flow Control (PFC) needs to be configured in the network.

When the NIC is configured for RoCE on a host along with the RoCE QOS configuration pkg (`bnxt_re_conf`), the NIC is automatically configured for DCQCN-P along with the following settings:

- RoCE v2 packets are marked with a DSCP value of 26 and use Priority 3 internally
- CNP packets are marked with a DSCP value of 48 and use Priority 7 internally
- PFC is enabled for Priority 3 traffic
- Three Traffic classes are set up, TC0 for non-RoCE traffic, TC1 for RoCE traffic, and TC2 for CNP traffic
- RoCE and non-RoCE traffic share ETS bandwidth of 50% each. The ETS bandwidth share applies only when the actual traffic is available to use the bandwidth share. In the absence of non-RoCE traffic, all the available bandwidth will be used by RoCE and conversely.
- CNP traffic is treated as ETS Strict Priority.

```
$ niccli -i 1 qos --ets --show
```

```

```

Broadcom provides tools NICCLI and bnxsetupcc.sh that allow changing the DSCP values, the Priority values, the ETS settings, and the PFC settings.

NOTE: The important thing to note is that the settings on the NIC and the Ethernet switches match each other.

Most network switches used for RoCE are based on Broadcom Ethernet switch silicon. The switch silicon provides the ability to configure PFC and Congestion Control settings. Prominent switch vendors such as Dell, Arista, Supermicro, Juniper Networks and so forth, implement their own Software Stacks for Ethernet switches. Each vendor provides their own command line interface (CLI) to configure the switches. The following sections describe how to configure popular Dell, Arista, Juniper Networks, and Supermicro switch models for PFC and DCQCN-P.

The switch configuration elements required are as follows:

- Map DSCP traffic priorities for RoCE and CNP traffic to traffic classes
- Enable PFC
- Enable ECN
- Configure ECN marking algorithm and ECN marking threshold

2.5.1 Example: Arista 7060CX (DCQCN-P at 400G) and 31-bit Subnet Scheme

```
qos map traffic-class 3 to dscp 26
qos map traffic-class 7 to dscp 48
```

```
qos profile QOS_ROCE_DCQCN
  qos trust dscp
  priority-flow-control on
  priority-flow-control priority 3 no-drop
  !
  uc-tx-queue 0

        priority strict-high;
    }
}
}

```

2.6 Final Checks and Settings for Optimal Performance

The following final checks can be made to ensure that the software, the firmware, the tools, and other settings are configured correctly for optimal Peer Memory Direct performance.

1. Ensure the `bnxt_en.ko`, `bnxt_re.ko`, and `ib_peer_mem.ko` kernel modules are loaded and are the correct version.

NOTE: Certain Ubuntu kernels have built-in `ib_peer_mem` support; these kernels do not require `ib_peer_mem` to be built and loaded from the Broadcom-provided release. The kernel driver Makefile can detect if `ib_peer_mem` is required to be built or not and act accordingly.

```
./nic_wizard diag roceanalyzer -st
```

2. Ensure that the file `/etc/bnxt_re/bnxt_re.conf` has the correct RoCE QOS values and each NIC has the correct QOS settings. The QOS settings on each NIC can be confirmed via the following `niccli qos --ets --show` command:

```
niccli --dev <index | pci b:d:f | mac> qos --ets --show
./nic_wizard diag roceanalyzer -q
```

3. The AMD GPU driver `amdgpu.ko` is loaded.
 4. PCIe Access Control Service (ACS) is disabled on the PCIe switch connecting the NIC and the GPU to allow PCIe Peer to Peer Transactions between the GPU and the NIC. If ACS is enabled, performance will degrade.
 5. IOMMU is disabled or is in Pass Through (PT) mode.
- ```
./nic_wizard diag roceanalyzer -p
```
6. The following standard InfiniBand Commands work correctly. These commands are part of the `infiniband-diags` package which can be downloaded by the OS distro's package manager:

```
- ibstatus
```

```
- ibv_devinfo -vvv
- ibdev2netdev
```

7. NIC NVM Configuration (to enable RDMA, performance profile, and PCIe Relaxed Ordering) is set to enabled.

```
./nic_wizard diag roceanalyzer -n
```

8. The NIC interface shows the NIC link is up and linked at the correct speed. This can be verified using one of the following commands.

```
- ibstatus
- ethtool <ifname>
```

9. To verify link configurations use the following command:

```
./nic_wizard diag roceanalyzer -L
```

10. An IP address is assigned to the NIC interface and the IP address is visible as GID 3 for IPv4 addresses or IPv6 addresses in the `ibv_devinfo -vvv` command:

```
- rdma link show
- ibv_devinfo -vvv
- ibv_devinfo -vvv -d <roce_interface_name>
 (example, ibv_devinfo -vvv -d bnxt_re0)
```

11. Interface MTU size is set to 9000 bytes on the host for maximum throughput.

12. The Ethernet switch port to which the NIC connects has its MTU set to 9000.

13. The PCIe slot for the NIC shows correct PCIe GEN speed and width.

```
- lspci -vvv -s <B:D:F>
```

14. To verify the mtu for jumbo packets, PCIe slot information. use the following command:

```
./nic_wizard diag roceanalyzer -p
```

15. Firewall is disabled on the communicating hosts in case it prevents RDMA connections from being set up.

16. There are no NIC and GPU-related errors in the Linux dmesg logs.

17. For RCCL testing, NUMA balancing is disabled on each host participating in the RCCL tests.

```
echo 0 > /proc/sys/kernel/numa_balancing or
sysctl -w kernel.numa_balancing=0
```

Another option is to add the following entry to file `/etc/sysctl.d/99-sysctl.conf` so that the setting takes effect automatically after a reboot.

```
kernel.numa_balancing=0
```

## 2.7 Installing and Compiling Perfctest with AMD GPU Support

**NOTE:** The following instructions are intended for recompiled perfctest utility that can be run directly from the home directory. The instructions assume ROCm is already installed. See [ROCm Installation](#) for details.

```
sudo apt install libibumad-dev
sudo apt install pciutils
sudo apt install libpci*
sudo apt install automake autoconf libtool libibverbs-dev ibverbs-utils infiniband-diags ethtool
librdmacm-dev
```

```
cd $HOME
git clone https://github.com/linux-rdma/perfctest.git
cd perfctest
./autogen.sh
./configure --prefix=`pwd` --enable-rocm --with-rocm=/opt/rocm
make
```

```
./ib_write_bw -h | grep -i rocm
--use_rocm=<rocm device id> Use selected ROCm device for GPUDirect RDMA testing
```

## 2.8 Validating Peer Memory Direct Support with Perfctest

This section provides information on validating Peer Memory Direct Support with Perfctest.

### 2.8.1 Using AMD GPU

```
$HOME/perfctest/bin/ib_write_bw -d <roce-interface-name> --use_rocm=<gpu-id> -a -F -x 3 --report_gbits
-q 2 -b
```

### 2.8.2 Example – ib\_write\_bw Test Using Broadcom NIC with AMD GPU

Following is an example of running `ib_write_bw` test using Broadcom NIC with AMDGPU across Host1, NIC0, and Host2, NIC4. For the best `peer_memory` direct performance, the GPUs used for this test should be the ones closest to the NIC on the PCIe Bus.

```
Host1,NIC0

$ rdma link show | grep -i bnxt_re0
link bnxt_re0/1 state ACTIVE physical_state LINK_UP netdev enp29s0np0

$ ethtool -i enp29s0np0 | grep -i bus
bus-info: 0000:1d:00.0

$ ip a | grep -i enp29s0np0 | grep -i "inet "
inet 1.1.101.15/31 scope global enp29s0np0

$ rocm-smi --showbus
GPU[0] : PCI Bus: 0000:1C:00.0
GPU[1] : PCI Bus: 0000:42:00.0
GPU[2] : PCI Bus: 0000:55:00.0
GPU[3] : PCI Bus: 0000:68:00.0
GPU[4] : PCI Bus: 0000:9E:00.0
GPU[5] : PCI Bus: 0000:C2:00.0
GPU[6] : PCI Bus: 0000:D4:00.0
GPU[7] : PCI Bus: 0000:E6:00.0

Host2,NIC4

$ rdma link show | grep -i bnxt_re4
link bnxt_re4/1 state ACTIVE physical_state LINK_UP netdev enp159s0np0

$ ethtool -i enp159s0np0 | grep -i bus
bus-info: 0000:9f:00.0

$ ip a | grep -i enp159s0np0 | grep -i "inet "
inet 1.1.102.45/31 scope global enp159s0np0

$ rocm-smi --showbus
GPU[0] : PCI Bus: 0000:1C:00.0
GPU[1] : PCI Bus: 0000:42:00.0
GPU[2] : PCI Bus: 0000:55:00.0
GPU[3] : PCI Bus: 0000:68:00.0
GPU[4] : PCI Bus: 0000:9E:00.0
```

```
GPU[5] : PCI Bus: 0000:C2:00.0
GPU[6] : PCI Bus: 0000:D4:00.0
GPU[7] : PCI Bus: 0000:E6:00.0
```

From the NIC PCIe B:D:F and the GPU PCIe B:D:F, we can infer that the GPU0 is nearest to NIC0 on host 1 and GPU4 is nearest to NIC4 on host 2.

```
Start Server on Host1
```

```
$ $HOME/perftest/bin/ib_write_bw -d bnxt_re0 --use_rocm=0 -a -F -x 3 -q 4 --report_gbits -b
```

```
Start Client on Host2
```

```
$ $HOME/perftest/bin/ib_write_bw -d bnxt_re4 --use_rocm=4 -a -F -x 3 -q 4 --report_gbits -b
--bind_source_ip 1.1.102.45 1.1.101.15
```

```
Using ROCm Device with ID: 4, Name: AMD Instinct MI300X, PCI Bus ID: 0x9e, GCN Arch:
gfx942:sramecc+:xnack-
allocated 67108864 bytes of GPU buffer at 0x7f3e83e00000
```

---

deallocating GPU buffer 0x7f3e83e00000

**NOTE:** The GPU buffers allocated before the start of the test and deallocated after test completion. This confirms that perfest is running with Peer Mem.

## Chapter 3: System BIOS

### 3.1 BIOS Setting Recommendations

The following BIOS settings (see [Table 2](#)) are recommended by Dell for their XE9680 AI//ML server. The BIOS settings disable IOMMU and ACS on the host as well.

**Table 2: BIOS Settings Recommendations**

| UEFI/BIOS Area                 | Value                                           |
|--------------------------------|-------------------------------------------------|
| BIOS -> Processor Settings     | Logical Processor = Disable                     |
|                                | Virtualization Technology = Disable             |
|                                | SubNumaCluster = Disable                        |
|                                | MADt Core cluster = Linear                      |
| BIOS -> Integrated Devices     | Global SRIOV = Disable                          |
| BIOS -> System Profile Setting | Server System Profile = Performance             |
|                                | Workload = Not Configured                       |
| BIOS -> System Security        | AC Recovery Delay = Random (highly recommended) |

To verify the bios settings use the following command:

```
./nic_wizard diag roceanalyzer -b
```

## Chapter 4: Atlas2 PCIe Switch Configuration

There are four switches in the system. Each switch is partitioned into two virtual switches. Each VS has 4 to 5 downstream ports. Station 0 is configured as 4 x 4 and other stations are all x16.

See [Appendix D, PCIe Link Speed and Width Related Scripts](#) for a bash shell script that can be used to disable ACS on a host.

## Chapter 5: Debugging Thor2 NIC

### 5.1 Frequently Asked Questions and Troubleshooting

1. RoCE interface names on a host do not have names like `bnx_re0`, `bnxt_re1`, and so forth.

This is due to the setting `NAME_FALLBACK` in file

`/usr/lib/udev/rules.d/60-rdma-persistent-naming.rules` as follows:

```
ACTION=="add", SUBSYSTEM=="infiniband", PROGRAM="rdma_rename %k NAME_FALLBACK"
```

With `NAME_FALLBACK`, the RoCE interfaces are named based on the PCIe ID of the PCIe slot used for the NIC.

Replacing `NAME_FALLBACK` with `NAME_KERNEL` will rename the RoCE interfaces to the `bnxt_reX` format.

2. RoCE perfests (`ib_write_bw`, `ib_read_bw`, `ib_send_bw`) fail with status 12 as shown in the following example:

```
ib_write_bw -d roceo3811 -F -x 3 192.168.1.11
```

```

RDMA_Write BW Test
Dual-port : OFF Device : roceo3811
Number of qps : 1 Transport type : IB
Connection type : RC Using SRQ : OFF
PCIe relax order: ON
ibv_wr* API : OFF
TX depth : 128
CQ Moderation : 100
Mtu : 4096[B]
Link type : Ethernet
GID index : 3
Max inline data : 0[B]
rdma_cm QPs : OFF
Data ex. method : Ethernet

local address: LID 0000 QPN 0x2c02 PSN 0xab5dfe RKey 0x2000007 VAddr 0x007ff32cb4a000
GID: 00:00:00:00:00:00:00:00:00:00:255:255:192:168:01:13
remote address: LID 0000 QPN 0x2c02 PSN 0x987205 RKey 0x2000207 VAddr 0x007fee3ba00000
GID: 00:00:00:00:00:00:00:00:00:00:255:255:192:168:01:11

Completion with error at client
Failed status 12: wr_id 0 syndrom 0xa
scnt=128, ccnt=0
Failed to complete run_iter_bw function successfully
```

Failed Status 12 means that the RoCE packets cannot be transferred across the connection and point to a networking error. Often (not always) this is due to the switch MTU not being set to 9000. On some switches, if the switch port belongs to a VLAN, the VLAN MTU size must be set to 9000 as well. By default, perfest uses a 64 KB msg size which requires multiple 4096 byte MTUs to transfer. Therefore, if the switch MTU is not configured to 9000, the switch drops 4096 byte RoCE packets.

3. How to check if `ib_peer_mem` is part of the kernel or if it must be loaded as `ib_peer_mem.ko` kernel module. Use the following command:

```
cat /proc/kallsyms | grep -i ib_register_peer_memory_client
```

If the `ib_register_peer_memory_client` symbol is provided by `ib_uverbs`, then `ib_peer_mem` is part of the kernel. Installing the Broadcom software stack will not install and load the `ib_peer_mem.ko` kernel module. If the output of the `cat` command shows that the `ib_register_peer_memory_client` symbol is provided by `ib_peer_mem`, it means that the Broadcom `ib_peer_mem` kernel module is loaded into the kernel. If the `cat` command returns empty, the `ib_peer_mem` is not yet loaded into the kernel. Installing the Broadcom stack should load the module.

```
$ cat /proc/kallsyms | grep -i ib_register_peer_memory_client
0000000000000000 r __kstrtab_ib_register_peer_memory_client [ib_uverbs]
0000000000000000 r __kstrtabns_ib_register_peer_memory_client [ib_uverbs]
0000000000000000 r __ksymtab_ib_register_peer_memory_client [ib_uverbs]
0000000000000000 r __crc_ib_register_peer_memory_client [ib_uverbs]
0000000000000000 r __export_symbol_ib_register_peer_memory_client [ib_uverbs]
0000000000000000 t __pfx_ib_register_peer_memory_client [ib_uverbs]
0000000000000000 T ib_register_peer_memory_client [ib_uverbs]
```

#### 4. How to check the ROCm and RCCL versions installed on the host.

On Ubuntu-based hosts, use the command `dpkg -l | grep -i rocm-core`. On RHEL based hosts, use the `rpm -qa | grep -i rocm-core` command. When ROCm is installed on the host, RCCL is also installed by the same pkg. The ROCm and RCCL versions usually match, unless RCCL is downloaded and installed separately, for example from GitHub. Passing the value **version** to the `NCCL_DEBUG` environment variable during `rccl-tests` prints the rccl version in use. See [MultiNode RCCL Collectives Using Open MPI](#).

#### 5. QOS (PFC, DSCP, ETS) is not configured after RoCE driver load or host reboot.

If the `NICCLI getqos` command shows an output similar to the following, the QOS for RoCE is not configured.

```
$ sudo niccli -i <index | pci b:d:f | mac> qos --ets --show
IEEE 8021QAZ ETS Configuration TLV:
 PRIO_MAP: 0:0 1:0 2:0 3:0 4:0 5:0 6:0 7:0
 TC Bandwidth: 0% 0% 0% 0% 0% 0% 0% 0%
 TSA_MAP: 0:strict 1:strict 2:strict 3:strict 4:strict 5:strict 6:strict 7:strict
IEEE 8021QAZ PFC TLV:
 PFC enabled: none
```

This generally means that firmware-based DCBX or firmware-based LLDP is enabled and the RoCE driver (`bnxt_re`) did not configure the QOS for the given NIC interface. The `dmesg` logs have errors similar to the following:

```
infiniband bnxt_re2: Fail to setets rc:-22
infiniband bnxt_re2: Fail to initialize Flow control
```

Ensure that the following NVM CFGs are disabled. See [Firmware Based DCBx NVM CFG on NIC](#).

- a. `dcbx_mode`
- b. `lldp_nearest_bridge`
- c. `lldp_nearest_non_tpmr_bridge`

#### 6. The following error is seen when running RDMA-related commands such as:

```
$ ibv_devinfo -vvv
libibverbs: Warning: Driver bnxt_re does not support the kernel ABI of 6 (supports 1 to 1) for device /sys/class/infiniband/bnxt_re0
libibverbs: Warning: Driver bnxt_re does not support the kernel ABI of 6 (supports 1 to 1) for device /sys/class/infiniband/bnxt_re0
```

This means the inbox `libbnxt_re` library is being used. We need to use the out of box `libbnxt_re` library. This can happen if the out of box library has not been installed or the `rdma-core` package on the host has been updated. Use the command `strace ibv_devinfo 2>&1 | grep libbnxt_re | grep -v 'No such file'` identify the path of the current `libbnxt_re` library and rename or delete it.

```
$ strace ibv_devinfo 2>&1 | grep libbnxt_re | grep -v 'No such file'
openat(AT_FDCWD, "/usr/lib/x86_64-linux-gnu/libibverbs/libbnxt_re-rdmav34.so",
O_RDONLY|O_CLOEXEC) = 3
```

#### 7. Broadcom software installation fails due to errors similar to:

```
bnxt_re: disagrees about version of symbol ib_umem_release
bnxt_re: Unknown symbol ib_umem_release (err -22)
bnxt_re: disagrees about version of symbol ib_modify_qp_is_ok
bnxt_re: Unknown symbol ib_modify_qp_is_ok (err -22)
```

Check if the MLNX OFED is installed on the host. MLNX OFED install removes the standard RDMA/`ib_core` kernel modules and `rdma-core` user space libraries from the host and installs MLNX OFED specific variants. After that, the install of the Broadcom RoCE software stack fails. Check for the presence of `/usr/sbin/ofed_uninstall.sh` shell script. If the script exists, it indicates MLNX OFED is installed on the host. Execute `/usr/sbin/ofed_uninstall.sh` which uninstalls MLNX OFED from the host, then reboot the host. After reboot, the `/usr/sbin/ofed_uninstall.sh` script no longer exists and the Broadcom stack installs.

#### 8. RoCE (non-GPU) performance using `perftest (ib_write_bw)` is low (~235 Gbps) but GPU based `perftest (ib_write_bw)` performance is at line rate (~320 Gbps).

One of the reasons for low RoCE (non-GPU) performance, but good GPU based RoCE performance is the **Memory Interleaving** BIOS setting on some hosts. The **Memory Interleaving** option should not be disabled and set to **Auto**. If disabled, RoCE (non-GPU) performance suffers due to Host Memory BW limitation.

#### 9. How to capture RoCE packets on a host using `tcpdump`.

For debug purposes, RoCE packets can be captured on a host via `tcpdump`. RoCE packet capture is not a production feature as it has its side effects, but can be very useful in debugging certain problems. The following two NVM CFG options must be modified to enable RoCE packet capture.

- a. `enable_sriov` should be set to value 0 (Disabled)
- b. `default_evb_modes` should be set to value 3 (none)

To check the option values, use the following commands:

```
sudo niccli -i <index | pci b:d:f | mac> nvm --getoption enable_sriov
The highlighted item will change depending on the index or PCIE BDF or MAC
```

```
Example:
sudo niccli -i 1 nvm --getoption enable_sriov
```

```
sudo niccli -i <index | pci b:d:f | mac> nvm --getoption default_evb_mode --scope <pf number>
First highlighted item will change depending on the index or PCIE BDF or MAC
Second highlighted item will change depending on the PF
```

```
Example:
sudo niccli -i 1 nvm --getoption default_evb_mode --scope 0
```

To set the value of the options, use the following commands:

```
sudo niccli -i <index | pci b:d:f | mac> nvm --setoption enable_sriov --value 0
The highlighted item will change depending on the index or PCIE BDF or MAC
```

# Example:

```
$ sudo niccli -i 1 nvm --setoption enable_sriov --value 0
```

```
$ sudo niccli -i <index | pci b:d:f | mac> nvm --setoption default_evb_mode --scope <pf number>
--value 3
```

# First highlighted item will change depending on the index or PCIE BDF or MAC

# Second highlighted item will change depending on the PF

# Example:

```
$ sudo niccli -i 1 nvm --setoption default_evb_mode --scope 0 --value 3
```

A reboot is required for the modified NVM CFGs to take effect. After the reboot, tcpdump must be run on the Ethernet interface name (not the RoCE interface name). See the following example:

```
$ rdma link show
link bnxt_re0/1 state ACTIVE physical_state LINK_UP netdev enp30s0np0
link bnxt_re1/1 state ACTIVE physical_state LINK_UP netdev enp67s0np0
link bnxt_re2/1 state ACTIVE physical_state LINK_UP netdev enp86s0np0
link bnxt_re3/1 state ACTIVE physical_state LINK_UP netdev enp105s0np0
link bnxt_re4/1 state ACTIVE physical_state LINK_UP netdev enp160s0np0
link bnxt_re5/1 state ACTIVE physical_state LINK_UP netdev enp195s0np0
link bnxt_re6/1 state ACTIVE physical_state LINK_UP netdev enp213s0np0
link bnxt_re7/1 state ACTIVE physical_state LINK_UP netdev enp231s0np0
```

```
$ tcpdump -i enp30s0np0 udp
```

Starting with the 2.34 release, roce pkt capture via tcpdump requires tcpdump to be executed on the RoCE interface name instead of the ethernet interface name.

```
$ tcpdump -i bnxt_re0 udp
```

## 5.2 BCM\_SOSREPORT

The Broadcom SOS reporting tool builds on the open source `sosreport` tool to collect system information for support purposes. The following sections describe how to create the `bcm_sosreport` package and how to install and run the tool. The report that is generated can be sent to a Broadcom support representative for analysis.

On a Ubuntu host, the tool can be installed and executed as follows:

```
To install the tool on a Ubuntu Host
$ dpkg -i bcm_sosreport_<version>.deb
```

```
To execute the tool
$ bcm_sosreport
```

See the [following link](#) for additional details on `bcm_sosreport`.

## Chapter 6: Installing AMD GPU Drivers

The installing of the ROCm software stack as described in section ROCm Installation installs the AMD GPU driver `amdgpu` as well. However, there can be changes across ROCm releases, therefore, see the ROCm official documentation at <https://rocm.docs.amd.com/projects/install-on-linux/en/latest/>.

## Chapter 7: Debugging AMD Instinct MI300 Series Accelerators

If the `rocm-smi` command does not display any GPU in the system, it indicates that the AMD GPU driver `amdgpu` is not loaded. Use the following commands to check the status of the `amdgpu` driver:

1. `lsmod | grep -i amdgpu`
2. `modinfo amdgpu`
3. `dkms status`
4. `dmesg | grep -i amdgpu`

See the following AMD instructions to collect debug info to troubleshoot problems related to the GPU:

<https://github.com/amddcgpuce/rocmtechsupport>

## Chapter 8: Running RCCL Collectives

Install RCCL as described in [Peer Memory Direct Configuration with BCM957608](#).

To run RCCL across multiple nodes in a cluster, Open MPI installation is required. Open MPI is only used to launch the RCCL tests or processes across multiple nodes. Additionally, UCX can be used along with Open MPI to launch the RCCL tests/processes across multiple nodes. RCCL itself does not use Open MPI or UCX for its operation. See [Table 3](#) for the software component versions used for AI/ML/HPC applications. It is recommended to install and execute Open MPI, UCX, and rccl-tests as a non-root user. Passwordless SSH should be set up for the non-root user as well.

**Table 3: AMD GPU**

| Component Name    | Component Version                   |
|-------------------|-------------------------------------|
| RoCM/RCCL version | ROCM 6.3.1, 6.3.2, 6.3.3, and 7.1.0 |
| UCX version       | 1.19                                |
| OpenMPI version   | 5.0.8                               |
| OSU               | 7.5.1                               |
| RCCL Test         | 2.28.7                              |

### 8.1 Setting Up the Environmental Variable

To set up environment variables, use the following commands:

```
export UCX_VER=vXXX
export OMPI_VER=vXXX
```

**NOTE:** See [Table 3](#) for the correct version numbers.

### 8.2 Installing UCX for AMD GPUs

To install UCX for AMD GPUs, use the following examples:

```
The UCX build needs to point to the ROCm installation /opt/rocm
as shown in the steps below.

cd $HOME
git clone --recursive -b ${UCX_VER} https://github.com/openucx/ucx.git
cd ucx

./autogen.sh
mkdir ucx_install
mkdir build
cd build
../contrib/configure-release --disable-debug --disable-assertions --disable-params-check
--with-rocm=/opt/rocm --with-rc --with-ud --with-dc --with-dm --with-ib-hw-tm
--prefix=$HOME/ucx/ucx_install --disable-log
```

```
make -j $(nproc)
make -j $(nproc) install

Verify by running
$HOME/ucx/ucx_install/bin/ucx_info -d
```

## 8.3 Installing Open MPI for AMD GPUs

To install Open MPI for AMD GPUs, use the following commands:

```
The Open MPI build needs to point to the UCX installation $HOME/ucx/ucx_install
as shown in the steps below.

On Ubuntu please install flex
sudo apt install flex

cd $HOME
git clone --recursive -b $OMPI_VER https://github.com/open-mpi/ompi.git
cd ompi

./autogen.pl
mkdir build
mkdir ompi_install

cd build

../configure --prefix=$HOME/ompi/ompi_install --with-ucx=$HOME/ucx/ucx_install
--enable-mca-no-build=btl-uct

make -j $(nproc)
make -j $(nproc) install

Verify by running
$HOME/ompi/ompi_install/bin/ompi_info | grep Configure
```

Open MPI BTL openib requires Broadcom NIC PCIe vendor\_part\_id 0x1760 to be added to the file `$HOME/ompi/ompi_install/share/openmpi/mca-btl-openib-device-params.ini`, under:

```
[Broadcom BCM57XXX]
vendor_id = 0x14e4
```

The file `mca-btl-openib-device-params.ini` is installed as part of the Open MPI installation.

## 8.4 Compiling RCCL Tests

**NOTE:** The location of the RCCL library (`/opt/rocm/lib/`) can change with ROCm versions.

```
On Ubuntu install libstdc++-12-i
sudo apt install libstdc++-12-i
cd $HOME
git clone https://github.com/ROCmSoftwarePlatform/rccl-tests.git
cd rccl-tests/
```

```
MPI=1 MPI_HOME=$HOME/ompi/ompi_install/ RCCL_HOME=/opt/rocm/lib make -j $(nproc)
```

## 8.5 Single Node RCCL Collectives

This section provides information about single-node RCCL collectives.

### 8.5.1 Topology and Sample Test Results

This section provides the topology used and sample test results.

```
$ rocm-smi --showtopotype
```

```
===== ROCm System Management Interface =====

===== End of ROCm SMI Log =====
```

Single Node RCCL collectives do not use RoCE by default and can be exercised with the Broadcom `bnxt_en` and `bnxt_re` drivers removed as well. Single Node tests make use of the XGMI links for inter-GPU host communication.

However, the `LD_LIBRARY_PATH` should be set correctly for a single node run.

```
export LD_LIBRARY_PATH=$HOME/ompi/ompi_install/lib:$HOME/ucx/ucx_install/lib:$LD_LIBRARY_PATH
```

```
$ $HOME/rccl-tests/build/all_reduce_perf -b 8 -e 16g -f 2 -g 8
```

```

## 8.6 Testing Single Node RCCL Collectives Using NICs

It is possible to use the NICs with RCCL tests on a single node using the RCCL environment variable `RCCL_ENABLE_INTRANET=1`. With this setting, RCCL uses the NICs together with other GPU interconnects (XGMI or PCIe) when running on a single node. The advantage of using this environment variable is that it enables NIC testing on a single node itself.

## 8.7 MultiNode RCCL Collectives Using Open MPI

This section provides information about MultiNode RCCL Collectives using Open MPI.

### 8.7.1 Prechecks

This section provides information on the required prechecks:

- NIC IP addresses and their routings are configured.
- Passwordless ssh has been setup between the hosts.
- NUMA balancing is disabled on every host. This can be done at runtime using `echo 0 > /proc/sys/kernel/numa_balancing` or through `sysctl -w kernel.numa_balancing=0`. Another option is to add the following entry to file `/etc/sysctl.d/99-sysctl.conf` so that the setting takes effect automatically after a reboot.
- Each node used for the test has the `PATH` and `LD_LIBRARY_PATH` set correctly in the `.bashrc` file as follows:

```
export LD_LIBRARY_PATH=$HOME/mpi/mpi_install/lib:$HOME/ucx/ucx_install/lib:$LD_LIBRARY_PATH
export PATH=$HOME/mpi/mpi_install/bin:$HOME/ucx/ucx_install/bin:$PATH
```

### 8.7.2 Topology and Sample Test Results

This section provides the topology used and sample test results.

```
$ rocm-smi --showtopotype

```

In the RCCL tests that follow, four nodes are used to run the `all_reduce` and the `alltoall` collective. Each node has eight GPUs and eight NICs. All four Hosts connect to the same leaf switch.

### 8.7.2.1 Test: All-to-All

Both commands execute the same collective (all-to-all):

- The first command runs 32 processes (one process on each GPU on each of the four nodes).
- The second command runs 4 processes (one process on eight GPUs on each of the four nodes).

**NOTE:** Multi-line commands are shown in the following sections.

#### 8.7.2.1.1 Test: All-to-All (4 Nodes, 32 Processes)

```
/opt/AMD/install/mpi/bin/mpirun --allow-run-as-root --bind-to none --hostfile hostfile

## 8.7.2.2 Test: All-Reduce

Both commands execute the same collective (all-reduce):

- The first command runs 32 processes (one process on each GPU on each of the four nodes).
- The second command runs 4 processes (one process on eight GPUs on each of the four nodes).

**NOTE:** Multi-line commands are shown in the following sections.

### 8.7.2.2.1 Test: All-Reduce (4 Nodes, 32 Processes)

```

/opt/AMD/install/mpi/bin/mpirun --allow-run-as-root --bind-to none --hostfile hostfile \

## 8.7.3 Debugging RCCL

This section contains information on debugging RCCL.

### 8.7.3.1 RCCL Environment Variable: NCCL\_DEBUG

The RCCL environment variable `NCCL_DEBUG` can be used to output debug info during the execution of the RCCL tests. The use of the `NCCL_DEBUG` is shown in [MultiNode RCCL Collectives Using Open MPI](#). Passing the value `NCCL_DEBUG=INFO` outputs more verbose information during the tests and can be used to check if Peer Memory Direct is indeed being used in addition to other useful debug information.

Correct CPU and GPU binding is necessary for optimal system performance. Sometimes, the affinity settings are affected by job schedulers such as SLURM, which can degrade RCCL performance. `NCCL_DEBUG=INFO` prints information that can be used to confirm the affinity masks are set correctly.

### 8.7.3.2 RCCL Environment Variable: NCCL\_SOCKET\_IFNAME

RCCL uses an out-of-band TCP connection for bootstrapping. Sometimes, there can be misconfigured IP interfaces (such as `docker0`) that can confuse RCCL. `NCCL_DEBUG=INFO` displays the network interface used by RCCL for bootstrapping. To avoid any potential RCCL bootstrap-related problem, use the environment variable `NCCL_SOCKET_IFNAME=<ifname>` to specify the desired bootstrap interface name as shown in [MultiNode RCCL Collectives Using Open MPI](#).

With `NCCL_DEBUG=INFO`, the RCCL output will show several lines indicating the RCCL bootstrap interface name as follows:

```
[0] NCCL INFO Bootstrap : Using eno8303:10.77.69.182<0>
```

### 8.7.3.3 RCCL Environment Variable: NCCL\_NET\_GDR\_LEVEL

The RCCL environment variable `NCCL_NET_GDR_LEVEL` can be used to enable or disable the use of Peer Memory Direct during the RCCL tests. Passing a value `NCCL_NET_GDR_LEVEL=0` disables the use of Peer Memory Direct between the GPU and the NIC. This variable can be used to determine if a given RCCL problem is related to Peer Memory Direct or not.

When Peer Memory Direct is being used, the `NCCL_DEBUG=INFO` output should include multiple lines indicating `NET/IB/<>/GDRDMA` as shown in the following example:

```
NCCL INFO Channel 00/0 : 15[e6000] -> 0[1c000] [receive] via NET/IB/0/GDRDMA comm 0x1aae1d0 nRanks 32
NCCL INFO Channel 01/0 : 14[d4000] -> 1[42000] [send] via NET/IB/6/GDRDMA comm 0x2736290 nRanks 32
```

When Peer Memory Direct is disabled via `NCCL_NET_GDR_LEVEL=0`, or Peer Memory Direct cannot be used for any reason, the `NCCL_DEBUG=INFO` output should include multiple lines indicating `NET/IB/0` as follows:

```
NCCL INFO Channel 00/0 : 10[55000] -> 1[42000] [receive] via NET/IB/0 comm 0x1a72740 nRanks 32
```

### 8.7.3.4 RCCL Environment Variable: NCCL\_IB\_HCA

The RCCL Environment variable `NCCL_IB_HCA` as shown in section [MultiNode RCCL Collectives Using Open MPI](#) can be used to select and deselect the RDMA-capable NICs from the RCCL tests. This environment variable can be useful to isolate a given problem NIC(s).

## Chapter 9: NIC and Ethernet Switch Configuration

Broadcom publishes an Ethernet NIC user guide that is publicly available. This guide contains detailed information on how to configure and use Broadcom NICs, including how to use the NIC for RoCE and Peer Memory Direct:

- [Broadcom Ethernet Network Adapter User Guide](#)
- [RDMA over Converged Ethernet \(RoCE\)](#)

Broadcom and Arista jointly publish a Broadcom RoCE Deployment guide that has more details on how to configure Arista switches for RoCE and RoCE congestion Control:

- [Lossless Network for AI/ML/Storage/HPC with RDMA](#)

## Appendix A: Compiling Broadcom NIC Software from Source

**NOTE:** The Broadcom `nic_wizard`'s installer `install` command installs the necessary packages automatically. To install by compiling the source code manually, use the following script.

This appendix shows example Linux shell scripts that can be used to compile and install Broadcom RoCE Kernel drivers and the user-space library `libbnxt_re` from source code. The script examples use the 232 release and the 232 release pkg file names as an example. Depending on the actual release and release pkg names being used, the script can be updated. Assuming the following scripts are placed in a file named `brcm_sw_compile_install.sh`, execute the script as follows:

```
chmod 777 brcm_sw_compile_install.sh

sudo ./brcm_sw_compile_install.sh | tee build_log.txt
or
sudo bash ./brcm_sw_compile_install.sh | tee build_log.txt
```

### A.1 Ubuntu: Install Script for NIC Software (Compiling from Source Code)

Install the NIC software using the following script:

```
#!/bin/bash

echo -e "\n\n=====Installing required pkgs=====\\n\\n"
sudo apt install linux-headers-"$(uname -r)" libelf-i
sudo apt install gcc make libtool autoconf librdmacm-dev rdmacm-utils infiniband-diags ibverbs-utils
perftest ethtool libibverbs-dev rdma-core strace

echo -e "\n\n=====Compiling and installing L2 and RoCE kernel drivers=====\\n\\n"
Highlighted item will change depending on the release
tar -xf netxtreme-peer-mem-234.0.154.0.tar.gz
cd netxtreme-peer-mem-234.0.154.0
make
sudo make install
sudo depmod -a
cd ..
echo -e "\n\n=====L2 and RoCE Kernel Driver Compile Complete=====\\n\\n"

echo -e "\n\n=====Loading built modules into the kernel=====\\n\\n"

#Unload the current version of the loaded drivers in case they are loaded.
sudo rmdir /sys/kernel/config/bnxt_re/* 2> /dev/null
sudo modprobe -r bnxt_re
sudo modprobe -r ib_peer_mem
sudo modprobe ib_peer_mem
#Make sure the 2 commands below, seperated by ";" are executed together in a single line
sudo rmmod bnxt_en; sudo modprobe bnxt_en
sudo modprobe bnxt_re
```

```

sudo update-initramfs -u -k `uname -r`

echo -e "\n\n=====

file=====

\n\n"

if [[$(grep '^* soft memlock unlimited$' /etc/security/limits.conf)]]; then
 echo "Soft MemLock ok"
else
 echo "Adding soft memlock unlimited to /etc/security/limits.conf"
 sudo sh -c "echo '* soft memlock unlimited' >> /etc/security/limits.conf"
fi

if [[$(grep '^* hard memlock unlimited$' /etc/security/limits.conf)]]; then
 echo "Hard MemLock ok"
else
 echo "Adding hard memlock unlimited to /etc/security/limits.conf"
 sudo sh -c "echo '* hard memlock unlimited' >> /etc/security/limits.conf"
fi

echo -e "\n\n=====

Highlighted item will change depending on the release

tar -xf libbnxt_re-234.0.154.0.tar.gz

cd libbnxt_re-234.0.154.0

sh autogen.sh

./configure

make

find /usr/lib64/ /usr/lib -name "libbnxt_re-rdmav*.so" -exec mv {} {}.inbox \;

sudo make install all

sudo sh -c "echo /usr/local/lib >> /etc/ld.so.conf"

sudo ldconfig

sudo cp -f bnxt_re.driver /etc/libibverbs.d/

## Appendix B: Helpful ROCm Commands

The `rocm-smi` command and its options provide very useful information related to the AMD GPUs and how the GPU.

### B.1 Checking the Type of GPUs on the Host

To check the type of GPU on the host, use the following commands:

```
$ rocm-smi --showhw --showallinfo | grep -i card
```

```
GPU[0] : Card series: AMD Instinct MI300X OAM
GPU[0] : Card model: 0x74a1
GPU[0] : Card vendor: Advanced Micro Devices, Inc. [AMD/ATI]
GPU[0] : Card SKU: MI3SRIOV
GPU[1] : Card series: AMD Instinct MI300X OAM
GPU[1] : Card model: 0x74a1
GPU[1] : Card vendor: Advanced Micro Devices, Inc. [AMD/ATI]
GPU[1] : Card SKU: MI3SRIOV
GPU[2] : Card series: AMD Instinct MI300X OAM
GPU[2] : Card model: 0x74a1
GPU[2] : Card vendor: Advanced Micro Devices, Inc. [AMD/ATI]
GPU[2] : Card SKU: MI3SRIOV
GPU[3] : Card series: AMD Instinct MI300X OAM
GPU[3] : Card model: 0x74a1
GPU[3] : Card vendor: Advanced Micro Devices, Inc. [AMD/ATI]
GPU[3] : Card SKU: MI3SRIOV
GPU[4] : Card series: AMD Instinct MI300X OAM
GPU[4] : Card model: 0x74a1
GPU[4] : Card vendor: Advanced Micro Devices, Inc. [AMD/ATI]
GPU[4] : Card SKU: MI3SRIOV
GPU[5] : Card series: AMD Instinct MI300X OAM
GPU[5] : Card model: 0x74a1
GPU[5] : Card vendor: Advanced Micro Devices, Inc. [AMD/ATI]
GPU[5] : Card SKU: MI3SRIOV
GPU[6] : Card series: AMD Instinct MI300X OAM
GPU[6] : Card model: 0x74a1
GPU[6] : Card vendor: Advanced Micro Devices, Inc. [AMD/ATI]
GPU[6] : Card SKU: MI3SRIOV
GPU[7] : Card series: AMD Instinct MI300X OAM
GPU[7] : Card model: 0x74a1
GPU[7] : Card vendor: Advanced Micro Devices, Inc. [AMD/ATI]
GPU[7] : Card SKU: MI3SRIOV
```

## B.2 Checking the PCIe BUS ID of Each GPU

To check the PCIe BUS ID of each GPU, use the following commands:

```
$ rocm-smi --showbus
```

```
===== ROCm System Management Interface =====
===== PCI Bus ID =====
GPU[0] : PCI Bus: 0000:1C:00.0
GPU[1] : PCI Bus: 0000:42:00.0
GPU[2] : PCI Bus: 0000:55:00.0
GPU[3] : PCI Bus: 0000:68:00.0
GPU[4] : PCI Bus: 0000:9E:00.0
GPU[5] : PCI Bus: 0000:C2:00.0
GPU[6] : PCI Bus: 0000:D4:00.0
GPU[7] : PCI Bus: 0000:E6:00.0
=====
===== End of ROCm SMI Log =====
```

## B.3 Checking the Processes Running on Each GPU

To check the process running on each GPU, use the following commands:

```
$ rocm-smi --showpidgpus
```

```
$ while true; do rocm-smi --showpidgpus ; sleep 1; done
```

```
===== ROCm System Management Interface =====
===== GPUs Indexed by PID =====
PID 2632418 is using 8 DRM device(s):
0 3 4 2 1 7 6 5

## Appendix C: Script for Disabling ACS

The following shell script can be used to disable ACS on a host that does not disable ACS by default via the BIOS. The script disables ACS on all ports that support ACS..

### C.1 Disable PCIe ACS

To disable PCIe ACS, use the following commands:

```
#!/bin/bash
#
Disable ACS on every device that supports it
#
PLATFORM=$(dmidecode --string system-product-name)
logger "PLATFORM=${PLATFORM}"
Enforce platform check here.
#case "${PLATFORM}" in
"OAM"*)
#logger "INFO: Disabling ACS is no longer necessary for ${PLATFORM}"
#exit 0
#;;
#*)
#;;
#esac
must be root to access extended PCI config space
if ["$EUID" -ne 0]; then
 echo "ERROR: $0 must be run as root"
 exit 1
fi
for BDF in `lspci -d "*:*:*" | awk '{print $1}'`; do
 # skip if it doesn't support ACS
 setpci -v -s ${BDF} ECAP_ACS+0x6.w > /dev/null 2>&1
 if [$? -ne 0]; then
 #echo "${BDF} does not support ACS, skipping"
 continue
 fi
 logger "Disabling ACS on `lspci -s ${BDF}`"
 setpci -v -s ${BDF} ECAP_ACS+0x6.w=0000
 if [$? -ne 0]; then
 logger "Error enabling directTrans ACS on ${BDF}"
 continue
 fi
 NEW_VAL=`setpci -v -s ${BDF} ECAP_ACS+0x6.w | awk '{print $NF}'`
 if ["${NEW_VAL}" != "0000"]; then
 logger "Failed to enabling directTrans ACS on ${BDF}"
 continue
 fi
done
exit 0
```

## C.2 List all PCIe Devices that Support ACS

To list all PCIe devices, use the following commands:

```
#!/bin/bash
#
for BDF in `lspci -n | awk '{print $1}'`; do
 if lspci -vvv -s "$BDF" | grep -qi ACSctl; then
 lspci -vvv -s "$BDF" | head -1
 lspci -vvv -s "$BDF" | grep -i ACSctl
 fi
done
```

## C.3 List all PCIe Devices with ACS Enabled

To list all PCIe devices with ACS enabled, use the following commands:

```
#!/bin/bash
#
for BDF in `lspci -n | awk '{print $1}'`; do
 if lspci -vvv -s "$BDF" | grep -i ACSctl | grep -qi SrcValid+; then
 lspci -vvv -s "$BDF" | head -1
 lspci -vvv -s "$BDF" | grep -i ACSctl
 fi
done
```

## C.4 List all PCIe Devices with ACS Disabled

To list all PCIe devices with ACS disabled, use the following commands:

```
#!/bin/bash
#
for BDF in `lspci -n | awk '{print $1}'`; do
 if lspci -vvv -s "$BDF" | grep -i ACSctl | grep -qi SrcValid-; then
 lspci -vvv -s "$BDF" | head -1
 lspci -vvv -s "$BDF" | grep -i ACSctl
 fi
done
```

## Appendix D: PCIe Link Speed and Width Related Scripts

This section provides scripts to get the PCIe link speed and width scripts.

### D.1 Displaying the Link Speed and Link Width of Every PCIe Component

To display the link speed and link width, use the following commands:

```
#!/bin/bash
#
for BDF in `lspci -d "*:*:*" | awk '{print $1}'`; do
 if lspci -vvv -s "$BDF" | grep -q LnkSta; then
 lspci -vvv -s "$BDF" | head -1
 lspci -vvv -s "$BDF" | grep LnkSta:
 fi
done
```

### D.2 Display Every PCIe Component with Downgraded Speed or Downgraded Width

To display every PCIe component with downgraded speed and width, use the following commands:

```
#!/bin/bash
#
for BDF in `lspci -d "*:*:*" | awk '{print $1}'`; do
 if lspci -vvv -s "$BDF" | grep -q downgraded; then
 lspci -vvv -s "$BDF" | head -1
 lspci -vvv -s "$BDF" | grep -i downgraded
 fi
done
```

## Appendix F: Terminology

This section provides terminology definitions for terms used in this document.

**Table 4: Terminology**

| Acronym   | Meaning                                                     |
|-----------|-------------------------------------------------------------|
| ACS       | PCIe Access Control Service                                 |
| ARP       | Address Resolution Protocol                                 |
| BTL       | Byte Transfer Layer                                         |
| CNP       | Congestion Notification Packet                              |
| DCBX      | Data Center Bridging Exchange protocol                      |
| DCQCN     | Data Centre quantized Congestion Notification               |
| DCQCN-P   | Data Centre quantized Congestion Notification-Probabilistic |
| DCQCN-D   | Data Centre quantized Congestion Notification-Deterministic |
| DKMS      | Dynamic Kernel Module Support                               |
| DSCP      | Differentiated Services Code Point                          |
| ECN       | Explicit Congestion Notification                            |
| ETS       | Enhanced Transmission Selection                             |
| IOMMU     | Input Output Memory Management Unit                         |
| L2        | Ethernet as Layer 2 protocol in the OSI model               |
| LLDP      | Link Layer Discovery Protocol                               |
| MLNX_OFED | Mellanox OFED driver pkg                                    |
| MTU       | Maximum Transmission Unit                                   |
| NUMA      | Non Uniform Memory Access                                   |
| OCF       | Open Compute Project                                        |
| Open MPI  | Open Message Passing Interface                              |
| PFC       | Priority Flow Control                                       |
| RCCL      | ROCm Communication Collectives Library                      |
| RDMA      | Remote Direct Memory Access                                 |
| NIC       | Network Interface Card                                      |
| RoCE      | RDMA over Converged Ethernet                                |
| ROCm      | AMD open source software stack designed for GPU compute     |
| SONiC     | Software for Open Networking in the cloud                   |
| UCX       | Unified Communication X                                     |
| VLAN      | Virtual Local Area Network                                  |
| XGMI      | AMD Infinity Fabric                                         |

## Revision History

### 957608-AN210; June 29, 2026

Added:

- [DKMS packages for Peer Memory Direct](#)

### 957608-AN209; April 13, 2026

Updated:

- Table 3, AMD GPU

Added:

- Quick Start Guide and Document Overview

### 957608-AN208; December 12, 2025

Updated:

- Chapter 7, Running NCCL Collectives

Added:

- Quick Start Guide and Document Overview

### 957608-AN207; July 9, 2025

Updated:

- Updated for 234 version of software.

### 957608-AN206; April 15, 2025

Updated:

- Replaced NICCLI getoption -name commands with nvm-getoption commands throughout.

### 957608-AN205; March 20, 2025

Updated:

- Broadcom Ethernet NIC Software Installation with Peer Memory Direct
- Topology and Sample Test Results
- Debugging Thor2 NIC

Added:

- Verifying the Correct RoCE QOS Configuration
- Ethernet Leaf Switch Port Configuration for 24-bit Subnet Scheme on Juniper QFX5240 Switch
- Ethernet Leaf Switch Port Configuration for 31-bit Subnet Scheme on Juniper QFX5240 Switch
- Example: Juniper QFX5240 Switch and 31-bit Subnet Scheme

## **957608-AN204; November 5, 2024**

### **Updated:**

- Updated revision history.

## **957608-AN203; October 28, 2024**

### **Updated:**

- Formatting updates.

## **957608-AN202; October 22, 2024**

### **Updated:**

- Updated GPU information.

## **957608-AN201; September 23, 2024**

### **Added:**

- General content updates.

## **957608-AN200; July 31, 2024**

Initial release.
