

## AEAT-901x Magnetic Encoder

### 10, 12, 14, 16, or 18-bit Angular Detection Device

#### Overview

The Broadcom<sup>®</sup> AEAT-901x series of magnetic encoders provides an integrated solution for angular detection. With ease of use in mind, these magnetic encoders are ideal for angular detection within 360°. Based on magnetic technologies, the device is noncontact and ensures reliable operations. It is able to provide absolute angle detection upon power-up, with a resolution of 0.0014 (18-bits version), 0.0055° (16-bits version), 0.022° (14-bits version), 0.0879° (12-bits version) or 0.35° (10-bits version), which is equivalent to 262144, 65536, 16384, 4096, and 1024 positions per revolution respectively. The positional data is provided in serial bit stream. There is no upper speed limit; the only restriction is that there will be fewer samples per revolution as the speed increases.

## Linearity Definitions

### Integral Nonlinearity

Integral nonlinearity (INL) is the maximum deviation between actual angular position and the position indicated by the encoder's output count, over one revolution. It is defined as the most positive linearity error +INL or the most negative linearity error -INL from the best fit line, whichever is larger.

### Differential Nonlinearity

Differential nonlinearity (DNL) is the maximum deviation of the step length from one position to the next.
