

ASMW-LG00, ASMW-LM00

0.5W 2835 Surface-Mount LED

Description

The Broadcom[®] ASMW-LG00 and ASMW-LM00 surface-mount LEDs use InGaN chip technology with superior package design to enable them to produce higher light output with better flux performance. They can be driven at high current and are able to dissipate heat more efficiently, resulting in better performance with higher reliability.

These LEDs operate under a wide range of environmental conditions, making them ideal for various applications, including fluorescent replacement, under-cabinet lighting, retail display lighting, and panel lights.

To facilitate easy pick-and-place assembly, the LEDs are packed in tape and reel. Every reel is shipped in a single flux and color bin to provide close uniformity.

Features

- High reliability package with enhanced silicone resin encapsulation
- Moisture sensitivity level 3
- Available in green and deep blue colors
- Low package profile and large emitting area
- Enhanced corrosion resistance

Applications

- Specialty and architectural lighting
- Gaming and vending machine backlighting
- Industrial lighting; for example, tower lights
- Industrial equipment indicators

CAUTION! This LED is Class 1A ESD sensitive per ANSI/ESDA/JEDEC JS-001. Observe appropriate precautions during handling and processing. Refer to Application Note 1142 for additional details.

Figure 1: Package Dimensions

NOTE:

- All dimensions are in millimeters (inches).
- Tolerance is ± 0.20 mm unless otherwise specified.
- Encapsulation = silicone.
- Terminal finish = silver plating.
- Dimensions in brackets are for reference only.

Device Selection Guide ($T_J = 25^\circ\text{C}$, $I_F = 150$ mA)

Part Number	Color	Luminous Flux Φ_V (lm) ^{a, b}			Luminous Intensity, I_V (cd) ^c
		Min.	Typ.	Max.	Typ.
ASMW-LG00-NY10E	Green	38.0	41.0	47.0	14.8
ASMW-LM00-NGJ0E	Deep blue	8.0	8.6	11.0	2.7

a. Luminous flux, Φ_V , is measured at the mechanical axis of the package, and it is tested with a single current pulse condition.

b. Tolerance is $\pm 12\%$.

c. For reference only.

Absolute Maximum Ratings

Parameter	Green	Deep Blue	Unit
DC Forward Current ^a	180	200	mA
Peak Forward Current ^b	300	300	mA
Power Dissipation	630	740	mW
Reverse Voltage	Not designed for reverse bias operation		
LED Junction Temperature	125		°C
Operating Temperature Range	-40 to +100		°C
Storage Temperature Range	-40 to +100		°C

a. Derate linearly as shown in [Figure 12](#), [Figure 13](#), and [Figure 14](#).

b. Duty factor = 10%, frequency = 1 kHz.

Optical and Electrical Characteristics (T_J = 25°C, I_F = 150 mA)

Parameter	Min.	Typ.	Max.	Unit
Viewing Angle, 2θ _{1/2} ^a	—	120	—	Deg
Forward Voltage, V _F ^b				
Green	2.9	3.01	3.5	V
Deep Blue	2.9	3.08	3.7	V
Reverse Current, I _R at V _R = 4V ^c	—	—	10	μA
Dominant Wavelength, λ _d ^d				
Green	515.0	520.0	535.0	nm
Deep Blue	450.0	456.0	460.0	nm
Peak Wavelength, λ _p				
Green	—	516	—	nm
Deep Blue	—	451	—	nm
Thermal Resistance, R _{θJ-S} ^e				
Green	—	70	—	°C/W
Deep Blue	—	36	—	°C/W

a. θ_{1/2} is the off axis angle where the luminous intensity is half of the peak intensity.

b. Forward voltage tolerance = ± 0.1V.

c. Indicates production final test condition only. Long-term reverse biasing is not recommended.

d. The dominant wavelength, λ_d, is derived from the CIE Chromaticity diagram and represents the color of the lamp.

e. Thermal resistance from the LED junction to the solder point.

Part Numbering System

A S M W - L x₁ 0 0 - N x₂ x₃ x₄ x₅

Code	Description	Option
x ₁	Color	G Green
		M Deep blue
x ₂	Minimum Flux Bin	See the Flux Bin Limits (CAT) table.
x ₃	Maximum Flux Bin	
x ₄	Color Bin	0 Full color distribution
x ₅	Test Option	E Test current = 150 mA

Part Number Example:

ASMW-LG00-NY10E

- x₁ = G Green color
- x₂ = Y Minimum flux bin Y
- x₃ = 1 Maximum flux bin 1
- x₄ = 0 Full color distribution
- x₅ = E Test current = 150 mA

Bin Information

Flux Bin Limits (CAT)

Bin ID	Luminous Flux, Φ_V (lm)	
	Min.	Max.
Green		
Y	38.0	41.0
Z	41.0	44.0
1	44.0	47.0
Deep Blue		
G	8.0	9.0
H	9.0	10.0
J	10.0	11.0

Tolerance: $\pm 12\%$.

Forward Voltage Bin Limits (V_F)

Bin ID	Forward Voltage, V_F (V)	
	Min.	Max.
G04	2.9	3.0
G05	3.0	3.1
G06	3.1	3.2
G07	3.2	3.3
G08	3.3	3.4
G09	3.4	3.5
G10	3.5	3.6
G11	3.6	3.7

Tolerance: $\pm 0.1V$.

Color Bin Limits (BIN)

Bin ID	Dominant Wavelength, λ_d (nm)	
	Min.	Max.
Green		
1	515.0	520.0
2	520.0	525.0
3	525.0	530.0
4	530.0	535.0
Deep Blue		
8	450.0	455.0
9	455.0	460.0

Tolerance: ± 1.0 nm.

Example of bin information on reel and packaging label:

CAT: W Flux bin Y
 BIN: 2 Color bin 2
 VF: G05 V_F bin G05

NOTE: All dimensions are in millimeters (mm).

Precautionary Notes

Soldering

- Do not perform reflow soldering more than twice. Observe necessary precautions of handling moisture-sensitive devices as stated in the following section.
- Do not apply any pressure or force on the LED during reflow and after reflow when the LED is still hot.
- Use reflow soldering to solder the LED. Use hand soldering only for rework if unavoidable, but it must be strictly controlled to following conditions:
 - Soldering iron tip temperature = 315°C maximum
 - Soldering duration = 3 seconds maximum
 - Number of cycles = 1 only
 - Power of soldering iron = 50W maximum
- Do not touch the LED package body with the soldering iron except for the soldering terminals, because it may damage the LED.
- Confirm beforehand whether the functionality and performance of the LED are affected by hand soldering.

Figure 23: Recommended Board Reflow Direction

Handling Precautions

The encapsulation material of the LED is made of silicone for better product reliability. Compared to epoxy encapsulant, which is hard and brittle, silicone is softer and flexible. Observe special handling precautions during assembly of silicone-encapsulated LED products. Failure to comply might lead to damage and premature failure of the LED. For additional information, refer to Broadcom Application Note 5288, *Silicone Encapsulation for LED: Advantages and Handling Precautions*.

- Do not poke sharp objects into the silicone encapsulant. Sharp objects, such as tweezers or syringes, might apply excessive force or even pierce through the silicone and induce failures to the LED die or wire bond.
- Do not touch the silicone encapsulant. Uncontrolled force acting on the silicone encapsulant might result in excessive stress on the wire bond. Hold the LED only by the body.
- Do not stack assembled PCBs together. Use an appropriate rack to hold the PCBs.
- The surface of the silicone material attracts dust and dirt easier than epoxy does due to its surface tackiness. To remove foreign particles on the surface of silicone, use a cotton bud with isopropyl alcohol (IPA). During cleaning, rub the surface gently without putting too much pressure on the silicone. Ultrasonic cleaning is not recommended.
- For automated pick-and-place, Broadcom has tested a nozzle size with an outer diameter of 3.5 mm to work with this LED. However, due to the possibility of variations in other parameters, such as pick-and-place machine maker/model, and other settings of the machine, verify that the selected nozzle will not damage the LED.

Handling Moisture-Sensitive Devices

This product has a Moisture Sensitive Level 3 rating per JEDEC J-STD-020. Refer to Broadcom Application Note 5305, *Handling of Moisture Sensitive Surface Mount Devices*, for additional details and a review of proper handling procedures.

Before Use

- Store an unopened moisture barrier bag (MBB) at $40^{\circ}\text{C}/90\% \text{RH}$ for 12 months. If the actual shelf life exceeds 12 months and the humidity indicator card (HIC) indicates that baking is not required, it is safe to reflow the LEDs per the original MSL rating.
- Do not open the MBB prior to assembly (for example, for IQC). If unavoidable, properly reseal the MBB with fresh desiccant and HIC. The exposed duration must be taken in as floor life.

Control After Opening the MBB

- Read the HIC immediately upon opening the MBB.
- Keep the LEDs at $30^{\circ}\text{C}/60\% \text{RH}$ at all times, and complete all high-temperature-related processes, including soldering, curing, or rework, within 168 hours.

Control for Unfinished Reel

Store unused LEDs in a sealed MBB with desiccant or a desiccator at $5\% \text{RH}$.

Control of Assembled Boards

If the PCB soldered with the LEDs is to be subjected to other high-temperature processes, store the PCB in a sealed MBB with desiccant or desiccator at $5\% \text{RH}$ to ensure that all LEDs do not exceed their floor life of 168 hours.

Baking Is Required Under the Following Conditions

- The HIC indicator indicates a change in color for 10% and 5%, as stated on the HIC.
- The LEDs are exposed to conditions of $30^{\circ}\text{C}/60\% \text{RH}$ at any time.
- The LED's floor life exceeds 168 hours.

The recommended baking condition is: $60^{\circ}\text{C} \pm 5^{\circ}\text{C}$ for 20 hours.

Baking can be done only once.

Storage

The soldering terminals of these Broadcom LEDs are silver plated. If the LEDs are exposed in an ambient environment for too long, the silver plating might be oxidized, thus affecting its solderability performance. As such, keep unused LEDs in a sealed MBB with desiccant or in a desiccator at $5\% \text{RH}$.

Application Precautions

- The drive current of the LED must not exceed the maximum allowable limit across temperature as stated in this data sheet. Constant current driving is recommended to ensure consistent performance.
- The circuit design must cater to the entire range of forward voltage (V_F) of the LEDs to ensure that the intended drive current can always be achieved.
- The LED exhibits slightly different characteristics at different drive currents, which may result in a larger variation in performance (such as intensity, wavelength, and forward voltage). Set the application current as close as possible to the test current to minimize these variations.
- The LED is not intended for reverse bias. Use other appropriate components for such purposes. When driving the LED in matrix form, ensure that the reverse bias voltage does not exceed the allowable limit of the LED.
- This LED is designed to have enhanced gas corrosion resistance. Its performance has been tested according to the following conditions:
 - IEC 60068-2-43: $25^{\circ}\text{C}/75\% \text{RH}$, H_2S 15 ppm, 21 days.
 - IEC 60068-2-42: $25^{\circ}\text{C}/75\% \text{RH}$, SO_2 25 ppm, 21 days.
 - IEC 60068-2-60: $25^{\circ}\text{C}/75\% \text{RH}$, SO_2 200 ppb, NO_2 200 ppb, H_2S 10 ppb, Cl_2 10 ppb, 21 days.
- Because the actual application might not be exactly similar to the test conditions, verify that the LED will not be damaged by prolonged exposure in the intended environment.
- Avoid rapid changes in ambient temperatures, especially in high-humidity environments, because they cause condensation on the LED.
- If the LED is intended to be used in a harsh or outdoor environment, protect the LED by means of a protective cover against damages caused by rain water, water, dust, oil, corrosive gases, external mechanical stresses, and so on.

Thermal Management

The optical, electrical, and reliability characteristics of the LED are affected by temperature. Keep the junction temperature (T_J) of the LED below the allowable limit at all times. T_J can be calculated as follows:

$$T_J = T_A + R_{\theta J-A} \times I_F \times V_{Fmax}$$

Where:

T_A = Ambient temperature ($^{\circ}\text{C}$)

$R_{\theta J-A}$ = Thermal resistance from LED junction to ambient ($^{\circ}\text{C}/\text{W}$)

I_F = Forward current (A)

V_{Fmax} = Maximum forward voltage (V)

The complication of using this formula lies in T_A and $R_{\theta J-A}$. Actual T_A is sometimes subjective and hard to determine. $R_{\theta J-A}$ varies from system to system depending on design and is usually not known.

Another way of calculating T_J is by using the solder point temperature, T_S , as follows:

$$T_J = T_S + R_{\theta J-S} \times I_F \times V_{Fmax}$$

Where:

T_S = LED solder point temperature as shown in the following figure ($^{\circ}\text{C}$)

$R_{\theta J-S}$ = Thermal resistance from the junction to the solder point ($^{\circ}\text{C}/\text{W}$)

I_F = Forward current (A)

V_{Fmax} = Maximum forward voltage (V)

Figure 24: Solder Point Temperature on PCB

T_S can be easily measured by mounting a thermocouple on the soldering joint as shown in the preceding figure, while $R_{\theta J-S}$ is provided in this data sheet. Verify the T_S of the LED in the final product to ensure that the LEDs are operating within all maximum ratings stated in this data sheet.

Eye Safety Precautions

LEDs may pose optical hazards when in operation. Do not look directly at operating LEDs because your eyes might be injured. For safety reasons, use appropriate shielding or personal protective equipment
