## Form A, Solid State Relay (Photo MOSFET) (60V/0.2A/10Ω)

### Description

The Broadcom<sup>®</sup> ASSR-12XX Series consists of an AlGaAs infrared light-emitting diode (LED) input stage that is optically coupled to a high-voltage output detector circuit. The detector consists of a high-speed photovoltaic diode array and driver circuitry to switch on/off two discrete high-voltage MOSFETs. The relay turns on (contact closes) with a minimum input current of 3 mA through the input LED. The relay turns off (contact opens) with an input voltage of 0.8V or less.

The single channel configurations, ASSR-1218 and ASSR-1219, are equivalent to 1 Form A Electromechanical Relays (EMR), and the dual-channel configuration, ASSR-1228, is equivalent to 2 Form A EMR. They are available in 4-pin SO, 6-pin DIP, 8-pin DIP, and gull wing surface mount for DIP packages.

ASSR-1219 enables AC/DC and DC-only output connections. For DC-only connection, the output current,  $I_O$ , increases to 0.4A and the On-Resistance,  $R_{(ON)}$  reduces to 2.5Ω.

# Application Information

## On-Resistance and Derating Curves

The Output On-Resistance,  $R_{(ON)}$ , specified in this data sheet is the resistance measured across the output contact when a pulse current signal ( $I_O = 200 \text{ mA}$ ) is applied to the output pins. The use of a pulsed signal ( $\leq 30 \text{ ms}$ ) implies that each junction temperature is equal to the ambient and case temperatures. The steady-state resistance,  $R_{SS}$ , on the other hand, is the value of resistance measured across the output contact when a DC current signal is applied to the output pins for a duration sufficient to reach thermal equilibrium.  $R_{SS}$  includes the effects of the temperature rise in the device.

Figure 1, Figure 2, Figure 3, and Figure 4 specify the maximum average output current allowable for a given ambient temperature. The maximum allowable output current and power dissipation are related by the following expression, from which  $R_{SS}$  is calculated:

$$R_{SS} = P_{O(max)} \div (I_{O(max)})^2$$

Staying within the safe area assures that the steady state MOSFET junction temperature remains less than  $125^\circ\text{C}$ .
