

## ASSR-1410, ASSR-1411, and ASSR-1420

### General-Purpose, Form A, Solid State Relay (Photo MOSFET) (60V/0.6A/1Ω)

#### Description

The Broadcom® ASSR-14XX Series consists of an AlGaAs infrared light-emitting diode (LED) input stage that is optically coupled to a high-voltage output detector circuit. The detector consists of a high-speed photovoltaic diode array and driver circuitry to switch on/off two discrete high-voltage MOSFETs. The relay turns on (contact closes) with a minimum input current of 3 mA through the input LED. The relay turns off (contact opens) with an input voltage of 0.8V or less.

The single-channel configurations, ASSR-1410 and ASSR-1411, are equivalent to 1 Form A Electromechanical Relays (EMR), and the dual-channel configuration, ASSR-1420, is equivalent to 2 Form A EMR. They are available in 4-pin SO, 6-pin DIP, 8-pin DIP, and gull wing surface mount for DIP packages. Their electrical and switching characteristics are specified over the temperature range of  $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$ . They are used for general-purpose switching of signals and low-power AC/DC loads.

ASSR-1411 enables AC/DC and DC-only output connections. For DC-only connection, the output current,  $I_O$ , increases to 1.2A and the on-resistance,  $R_{(ON)}$ , reduces to  $0.5\Omega$ .

**CAUTION!** Take normal static precautions in the handling and assembly of this component to prevent damage and degradation that might be induced by electrostatic discharge (ESD). The components featured in this data sheet are not recommended to be used in military or aerospace applications or environments. The components are not AEC-Q100 qualified and not recommended for automotive applications.

## Applications Information

### On-Resistance and Derating Curves

The Output On-Resistance,  $R_{(ON)}$ , specified in this data sheet is the resistance measured across the output contact when a pulsed current signal ( $I_O = 0.6\text{ A}$ ) is applied to the output pins. The use of a pulsed signal ( $\leq 30\text{ ms}$ ) implies that each junction temperature is equal to the ambient and case temperatures. The steady-state resistance,  $R_{ss}$ , on the other hand, is the value of the resistance measured across the output contact when a DC current signal is applied to the output pins for a duration sufficient to reach thermal equilibrium.  $R_{ss}$  includes the effects of the temperature rise in the device.

Derating curves are shown in [Figure 1](#), [Figure 2](#), [Figure 3](#), and [Figure 4](#), specifying the maximum output current allowable for a given ambient temperature. The maximum allowable output current and power dissipation are related by the expression  $R_{ss} = P_o(\text{max})/(I_o(\text{max}))^2$  from which  $R_{ss}$  can be calculated. Staying within the safe area ensures that the steady-state MOSFET junction temperature remains less than  $125^{\circ}\text{C}$ .

### Turn-On Time and Turn-Off Time Variation

The ASSR-14xx Series exhibits a very fast turn-on and turn-off time. Both the turn-on and turn-off time can be adjusted by choosing proper forward current as depicted in [Figure 10](#) and [Figure 12](#). The changes of the turn-on and turn-off time with ambient temperature are also shown in [Figure 11](#) and [Figure 13](#).
