# HDLX-1414 Series

Four Character Smart Alphanumeric Displays

Description

These are 3.7-mm (0.145-in.) four character 5 × 7 dot matrix displays driven by an on-board CMOS IC. These displays are pin-for-pin compatible with the HPDL-1414.The IC stores and decodes 7-bit ASCII data and displays it in an easy to read 5 × 7 font. Multiplexing and LED drive circuitry are also included in the display, and fast setup and hold times allow it to interface easily with common microprocessors.

The address and data inputs can be directly connected to microprocessor address and data buses.

The HDLX-1414 offers a larger character set than the HPDL-1414. Lowercase letters and special symbols are now offered, made possible by the 5 × 7 dot matrix character layout.

The difference between the sunlight-viewable HDLS-1414 and the low-power HDLU-1414 lies in the brightness level. The sunlight-viewable version is internally set to provide high-intensity characters. The low-power version uses the same bright LED technology, but reduces the current through each LED to a much lower level, and maintains an intensity comparable to the HDLO-1414.
Features

- Dot matrix replacement of HPDL-1414
- Smart alphanumeric display
  Built-in RAM, ASCII decoder, and LED drive circuitry
- 128 ASCII character set
- End stackable
- Categorized for luminous intensity; Yellow and Green categorized for color
- Low-power and sunlight-viewable AlInGaP versions
- Wide viewing angle (50° typical)

Electrical Description

Pin Function	Description
\Write (\WR, Pin 3)	WR must be logic 0 to store data in the display.
Address Inputs (A_1 and A_0, Pins 4 and 5)	A_0 and A_1 select a specific location in the display memory. Address 00 accesses the far-right character, and address 11 accesses the far-left position.
V_{DD} (Pin 6)	VDD is the positive power supply input.
Ground (GND, Pin 7)	Ground is the display ground.
Data Inputs (D_0 to D_6, Pins 1, 2, 8 to 12)	D_0 to D_6 specify the input data for the display.

Display Internal Block Diagram

Figure 1 shows the HDLX-1414 display internal block diagram. The CMOS IC consists of a 4 × 7 character RAM, a 128-character ASCII decoder and the refresh circuitry necessary to synchronize the decoding and driving of four 5 × 7 dot matrix characters.

Four 7-bit ASCII words are stored in the character RAM. The IC reads the ASCII data and decodes it using the 128-character ASCII decoder. This decoder includes the 64-character set of the HPDL-1414, 32 lower case ASCII symbols, and 32 foreign language symbols.

Data Entry

Table 1 shows a truth table for the HDLX-1414 display. Address inputs A_0 and A_1 are used to select the digit location in the display. When A_0 and A_1 are both logic low, data is loaded into the right-most character.

Data inputs D_0 to D_6 are used to load information into the display. Data is latched into the given character address on the rising edge of the \WR signal. Data and Address inputs must be held stable during the write cycle to ensure that correct data is stored in the display.

Mechanical and Electrical Considerations

The HDLX-1414 is a 12-pin DIP package that can be stacked to create a character array of any size. The display is designed to operate reliably in –40°C to +85°C ambient temperatures.

The HDLX-1414 is assembled by die attaching and wire bonding 140 LEDs and a CMOS IC to a high-temperature printed circuit board. A polycarbonate lens is placed over the PC board, creating a protective air gap over the LED wire bonds. Backfill epoxy environmentally seals the display package. This package construction makes the display highly tolerant to temperature cycling and allows wave soldering.

ESD and Latchup Protection

The inputs to the CMOS IC are protected against static discharge and input current latchup. However, for best results, standard CMOS handling precautions should be used. Prior to use, the HDLX-1414 should be stored in antistatic tubes or conductive material. During assembly, use a grounded conductive work area, and assembly personnel should wear conductive wrist straps. Avoid lab coats made of synthetic material because they are prone to static charge build-up. Input current latchup can be caused when the CMOS inputs are subjected either to a voltage below ground (V_{in} < ground) or higher than V_{DD} (V_{in} > V_{DD}) and when a high current is forced into the input. To prevent input current latchup and ESD damage, unused inputs should be connected either to ground or to V_{DD}. Voltages should not be applied to the inputs until V_{DD} has been turned on, and high transient input voltages should be eliminated.

Soldering Instructions

The HDLX-1414 is compatible with hand- and wave-solder processes. The use of a no-clean flux is recommended.

The polycarbonate lens on these displays is incompatible with some fluxes and cleaning solutions. Do not use with heated Terpene, or solutions of propylene glycol monomethyl ether and monoethanolamine.

For further information on soldering and post-solder cleaning, see Application Note 1027, *Soldering LED Components*.

Contrast Enhancement

Contrast enhancement provides good readability in the end user's ambient lighting conditions. By using both luminance (brightness) and chrominance (color) contrast techniques, the ON dots of the display can be made to stand out against a dark background.

For further information on contrast enhancement, see Application Note 1015, *Contrast Enhancement Techniques for LED Displays*.
