CA Technologies Automation Momentum Continues

Happy New Year from CA Technologies!

A bright 2018 has begun, and momentum is strong. CA Technologies' new Automation Business Unit represents one of the largest, single expansion of CA's product portfolio in many years.

Across our portfolio, our investments are geared to increasing digital trust and intelligent automation. Our focus is on helping our clients build and maintain a robust, dynamic and secure Modern Software Factory from mainframe to mobile, including CA Workload Automation solutions (AE, DE, CA 7 and ESP). We are very proud of our CA Workload Automation solutions and they remain a vital set of mission critical applications, in an area where we are continuing investments and innovation. Watch Video

At the most recent CA World last November, UPS showcased how they are using CA Workload Automation ESP Edition to automate system maintenance and reduce the number of support cases by 36% in the first 90 days of implementation. Ameren demonstrated how their interactive map let customers know where power outages are by taking advantage of the additional job types in CA Workload Automation AE (AutoSys).

CA Workload Automation is a mainstay of our business and it continues to be an area where we invest a significant amount of our energy and resources, even as we also help you with the cloud and big data requirements.

If you have any questions, we'd be happy to discuss the strategic direction of workload automation with you, both from a market and product perspective. Please contact your CA Account Rep to arrange a call. As always, thank you for your business!

Kind Regards,

Todd
