

# Protect Your End-of-Life Windows Server 2003 Operating System

Services can help to mitigate risks in your Windows Server 2003 Systems after the end of support

Data Sheet: Security Consulting

## Methodology

Symantec Consulting helps organisations to capitalize on the full capability of Symantec solutions, minimise the risks associated with implementation of new solutions and reduce the time to realize return on investment.

## Windows Server 2003 End-of-Life – the Challenge

Microsoft no longer issues security updates for any version of Windows Server 2003. Customers still running Windows Server 2003 in their datacenter will need to take steps now to plan and execute a migration strategy to protect their infrastructure.

Symantec Data Center Security: Server Advanced enables organizations to:

- Harden their physical and virtual servers as well as their private clouds
- Continuously monitor the security and compliance posture of their on-premise data centers, public clouds and private clouds
- Protect legacy infrastructure from zero-day threats and new vulnerabilities
- Securely transition into software-defined data centers
- Enable microsegmentation to deliver application-centric security

## Services

Symantec Consulting includes a dedicated Project Manager who oversees the engagement from beginning to end. Each Consultant works diligently to arm customers with the tools and know-how to successfully manage and improve their implementation after the engagement is complete.

Based on our experience with successful Windows 2003 Server Assessments we have developed the following services to assess Windows Server 2003 risks:

- **Discovery Workshop** – understand the context and use of the Windows 2003 systems, obtain an inventory and plan out the detailed delivery based on the workshop output.
- **DCS: SA Low-Level Design** – The standard DCS:SA infrastructure design will be adapted to the context of the customer, utilising the information gathered during the Discovery Workshop.
- **Implementation and Policy Development** – DCS:SA server will be installed and configured according to the agreed low level design. Policies to protect the Windows 2003 Operating System will be configured, tested and piloted. A functional DCS infrastructure as well as a tested protection policy for the Windows 2003 Operating System will be available for deployment.
- **Initial Support to Production Roll-out** – assist in the initial production deployment of DCS:SA to endpoints

## Outcomes

The outcome of the service is to achieve an implementation of DCS:SA that provides critical protection of the Windows Operating system and to enable the Customer with a working solution providing the ability to further fine tune DCS:SA policies as required. Symantec will submit a customer satisfaction survey at the completion of each engagement.
